1 General

Fans, also referred to as blower convectors or Fan Coil units, are used for distributed HEATING and COOLING applications. They are installed in a room and powered via a central heating and cooling system. The room temperature can be quickly adjusted to suit individual preferences using this system.

The Fan Coil Actuator FCA/S 1.2.2.1 has two outputs for control of motor power operated or thermal heating and cooling valves. Fan Coil Actuators switch multi-level fans with up to three fan speeds using floating contacts. Furthermore, three binary inputs, e.g. for monitoring of a window contact and the dew point are available. An additional contact is possible, for example, for control of an electric heater.

1.1 Using the product manual

This manual provides you with detailed technical information relating to the function, installation and programming of the ABB i-bus[®] KNX Fan Coil Actuator. The application of the device is explained using examples.

This manual is divided into the following sections:

Chapter 1	General
Chapter 2	Device technology
Chapter 3	Commissioning
Chapter 4	Planning and application
Chapter A	Appendix

1.1.1 **Note**

Notes and safety instructions are represented as follows in this manual:

Note
Tips for usage and operation

Examples
Application examples, installation examples, programming examples

Important
These safety instructions are used as soon as there is danger of a malfunction without risk of damage or injury.

Caution
These safety instructions are used as soon as there is danger of a malfunction without risk of damage or injury.

 Danger
These safety instructions are used if there is a danger for life and limb with inappropriate use.

  Danger
These safety instructions are used if there is a danger to life with inappropriate use.

1.2 Product and functional overview

The Fan Coil Actuator FCA/S controls a single-phase fan with up to three fan speeds via a step or changeover control. In the mode *Changeover switch* this ensures that no two fan speeds can be switched on simultaneously. An additional programmable switch-over delay is provided for this purpose. Three-phase drives are not supported. The additional output can be used for control of an electrical load. Manual operation of the device is possible.

The FCA/S controls motor-power operated heating and cooling valves as well as multilevel fans via the outputs.

Three binary inputs are available, for example, as signalling contacts for window contact and dew point monitoring. The scanning voltage for the inputs is provided by the device.

The actuator is a modular installation device with a module width of 6 space units in Pro *M* design for installation in the distribution board. The connection to the ABB i-bus[®] is established using the front side bus connection terminal. The Fan Coil Actuator does not require an auxiliary voltage supply. The assignment of the physical addresses as well as the parameterization is carried out with Engineering Tool Software ETS.

2 Device Technology

The Fan Coil Actuator FCA/S 1.2.2.1 is a modular installation device (MDRC) in Pro M Design. It is intended for installation in the distribution board on 35 mm mounting rails. The assignment of the physical addresses as well as the parameterization is carried out with ETS.

The device is powered via the ABB i-bus® and does not require an additional auxiliary voltage supply. The FCA/S 1.2.2.1 is operational after connection of the bus voltage.

2.1 Technical data

Supply	Bus voltage	21...32 V DC
	Current consumption, bus	< 12 mA
	Leakage loss, bus	Maximum 250 mW
	Leakage loss, device	Maximum 2 W*
	*The maximum power consumption of the device results from the following specifications:	
	KNX connection	0.25 W
	Relay 16 A	1.0 W
	Relay 6 A	0.6 W
	Analog outputs	0.15 W
Connections	KNX	via bus connection terminals
	Inputs/Outputs	Via screw terminals
Connection terminals	Screw terminal	Screw terminal with universal head (PZ 1)
		0.2...4 mm² stranded, 2 x (0.2...2.5 mm²)
		0.2...6 mm² single core, 2 x (0.2...4 mm²)
	Ferrules without/with plastic sleeves	without: 0.25...2.5 mm²
		with: 0.25...4 mm²
	TWIN ferrules	0.5...2.5 mm²
		Contact pin length min. 10 mm

Weight	0.3 kg	
Housing/colour	Plastic housing, grey	

Device type	Application program	Maximum number of communication objects	Maximum number of group addresses	Maximum number of associations
FCA/S 1.2.2.1	Fan Coil Actuator 0...10V/...*	70	254	255

* ... = current version number of the application program. **Please observe the software information on our homepage for this purpose.**

Note

The ETS and the current version of the device application program are required for programming.

The current version of the application program is available for download on the internet at www.abb.com/knx. After import it is available in the ETS under *ABB/Heating, Ventilation, Air conditioning/Fan coil actuator 1-fold 0-10*.

The device does not support the locking function of a KNX device in the ETS. If you inhibit access to all devices of the project with a *BCU code*, it has no effect on this device. It can still be read and programmed.

2.1.1 Outputs Valve V1/2

Rated values	Number	2, non-isolated, short-circuit proofed
	Setting signal	0...10 V DC
	Signal type	Analogue
	Output load	> 10 kΩ
	Output tolerance	+/- 10 %
	Current limited	Up to 1.5 mA

2.1.2 Inputs

Rated values	Number	3
	Scanning current	1 mA
	Scanning voltage	10 V
	Contact scanning	Floating
Cable length	Between sensor and device input	Maximum 30 m, one-way

2.1.3 Fan rated current 6 A

Rated values	Number	3 contacts
	U _{n1} rated voltage	250/440 V AC (50/60 Hz)
	I _{n1} rated current (per output)	6 A
Switching currents	AC3* operation (cos φ = 0.45) EN 60 947-4-1	6 A/230 V
	AC1* operation (cos φ = 0.8) EN 60 947-4-1	6 A/230 V
	Fluorescent lighting load to EN 60 669-1	6 A/250 V (35 μ F) ¹⁾
	Minimum switching performance	20 mA/5 V
		10 mA/12 V
		7 mA/24 V
Service life	DC current switching capacity (resistive load)	6 A/24 V=
	Mechanical endurance	> 10 ⁷
	Electronic endurance to DIN IEC 60 947-4-1	
	AC1* (240 V/cos φ = 0.8)	> 10 ⁵
	AC3* (240 V/cos φ = 0.45)	> 1.5 x 10 ⁴
	AC5a* (240 V/cos φ = 0.45)	> 1.5 x 10 ⁴
Switching times ²⁾	Maximum relay position change per output and minute if only one relay is switched.	2,683

¹⁾ The maximum inrush-current peak may not be exceeded.

²⁾ The specifications apply only after the bus voltage has been applied to the device for at least 10 seconds. Typical delay of the relay is approx. 20 ms.

* What do the terms AC1, AC3 and AC5a mean?

In intelligent installation systems, different switching capacity and performance specifications that are dependent on the special applications, have become established in domestic and industrial installations. These performance specifications are rooted in the respective national and international standards. The tests are defined so that typical applications, e.g. motor loads (industrial) or fluorescent lamps (residential), are simulated.

The specifications AC1 and AC3 are switching performance specifications, which have become established in the industrial field.

Typical application:

- AC1 – Non-inductive or slightly inductive loads, resistive furnaces (relates to switching of ohmic/resistive loads)
- AC3 – Squirrel-cage motors: Starting, switching off motors during running (relates to (inductive) motor load)
- AC5a – Switching of electric discharge lamps

These switching performances are defined in the standard EN 60947-4-1 *Contactors and motor-starters - Electromechanical contactors and motor-starters*. The standard describes starter and/or contactors which previously preferably used in industrial applications.

2.1.4 Output rated current 20 AX

Rated values	Number	1
	U _{n2} rated voltage	250/440 V AC (50/60 Hz)
	I _{n2} rated current	20 A
Switching currents	AC3* operation (cos φ = 0.45) To EN 60 947-4-1	16 A/230 V
	AC1* operation (cos φ = 0.8) To EN 60 947-4-1	20 A/230 V
	Fluorescent lighting load AX to EN 60 669-1	20 A/250 V (140 μ F) ¹⁾
	Minimum switching performance	100 mA/12 V 100 mA/24 V
	DC current switching capacity (resistive load)	20 A/24 V=
	Mechanical service life	> 10 ⁶
	Electrical endurance to IEC 60 947-4-1	
Service life	AC1* (240 V/cos φ = 0.8)	> 10 ⁵
	AC3* (240 V/cos φ = 0.45)	> 3 x 10 ⁴
	AC5a (240 V/cos φ = 0.45)	> 3 x 10 ⁴
	Maximum relay position change per output and minute if only one relay is switched.	93
Switching times ²⁾		

¹⁾ The maximum inrush-current peak may not be exceeded.

²⁾ The specifications apply only after the bus voltage has been applied to the device for at least 10 seconds. Typical delay of the relay is approx. 20 ms.

* What do the terms AC1, AC3 and AC5a mean?

In intelligent installation systems, different switching capacity and performance specifications that are dependent on the special applications, have become established in domestic and industrial installations. These performance specifications are rooted in the respective national and international standards. The tests are defined so that typical applications, e.g. motor loads (industrial) or fluorescent lamps (residential), are simulated.

The specifications AC1 and AC3 are switching performance specifications, which have become established in the industrial field.

Typical application:

AC1 – Non-inductive or slightly inductive loads, resistive furnaces (relates to switching of ohmic/resistive loads)

AC3 – Squirrel-cage motors: Starting, switching off motors during running (relates to (inductive) motor load)

AC5a – Switching of electric discharge lamps

These switching performances are defined in the standard EN 60947-4-1 *Contactors and motor-starters - Electromechanical contactors and motor-starters*. The standard describes starter and/or contactors which previously preferably used in industrial applications.

2.1.5 Output lamp load 20 AX

Lamps	Incandescent lamp load	3680 W
Fluorescent lamp T5/T8	Uncorrected	3680 W
	Parallel compensated	2500 W
	DUO circuit	3680 W
Low-voltage halogen lamps	Inductive transformer	2000 W
	Electronic transformer	2500 W
	Halogen lamp 230 V	3680 W
Dulux lamp	Uncorrected	3680 W
	Parallel compensated	3000 W
Mercury-vapour lamp	Uncorrected	3680 W
	Parallel compensated	3680 W
Switching performance (switching contact)	Maximum peak inrush-current I_p (150 μ s)	600 A
	Maximum peak inrush-current I_p (250 μ s)	480 A
	Maximum peak inrush-current I_p (600 μ s)	300 A
Number of electronic ballasts (T5/T8, single element)¹⁾	18 W (ABB EVG 1 x 18 SF)	26 ²⁾
	24 W (ABB EVG-T5 1 x 24 CY)	26 ²⁾
	36 W (ABB EVG 1 x 36 CF)	22
	58 W (ABB EVG 1 x 58 CF)	12 ²⁾
	80 W (Helvar EL 1 x 80 SC)	10 ²⁾

¹⁾ For multiple element lamps or other types, the number of electronic ballasts must be determined using the peak inrush current of the electronic ballasts.

²⁾ Limited by protection with B16 automatic circuit-breakers.

Note

Terminals 1 and 4 are not internally assigned with FCA/S 1.2.2.1.

2.3 Dimension drawing

2CD 072 015 F0012

2.4 Assembly and installation

The device is a modular installation device for quick installation in the distribution board on 35 mm mounting rails to EN 60 715.

The mounting position can be selected as required.

The connection to the bus is implemented using the supplied bus connection terminal. The terminal assignment is located on the housing.

Accessibility to the device for the purpose of operation, testing, visual inspection, maintenance and repair must be provided compliant to VDE 0100-520.

Commissioning requirements

In order to commission the device, a PC with ETS and a KNX interface, e.g. USB or IP, are required. The device is ready for operation after connection to the bus voltage.

The installation and commissioning may only be carried out by qualified electrical specialists. The appropriate norms, guidelines, regulations and specifications for your country should be observed when planning and setting up electrical installations and security systems for intrusion and fire detection.

Protect the device from damp, dirt and damage during transport, storage and operation.

Only operate the device within the specified technical data limits!

The device should only be operated in an enclosed housing (distribution board)!

The voltage supply to the device must be switched off, before mounting work is performed.

Danger

In order to avoid dangerous touch voltages, which originate through feedback from differing phase conductors, all-pole disconnection must be observed when extending or modifying the electrical connections.

Foil keypad

The device incorporates manual operating features. Special device functions can be undertaken using the operating keys on the foil keypad.

The foil keypad may not be operated with pointed or sharp-edged objects, e.g. screwdrivers or pens. This may damage the keypad.

Supplied state

The device is supplied with the physical address 15.15.255. The application program is preloaded. It is therefore only necessary to load group addresses and parameters during commissioning. However, the complete application program can be reloaded if required. A longer downtime may result if the application program is changed or after a discharge.

Assignment of the physical address

The assignment and programming of the physical address is carried out in the ETS.

The device features a button *Programming*  for assignment of the physical device address. The red LED *Programming*  lights up after the button has been pushed. It switches off as soon as the ETS has assigned the physical address or the button  is pressed again.

Download behaviour

Depending on the PC, which is used, the progress bar for the download may take up to one and a half minutes before it appears due to the complexity of the device.

Cleaning

If devices become dirty, they can be cleaned using a dry cloth or a cloth dampened with a soapy solution. Corrosive agents or solutions should never be used.

Maintenance

The device is maintenance-free. No repairs should be carried out by unauthorised personnel if damage occurs, e.g. during transport and/or storage.

2.5 Manual operation

Function of manual operation

Manual operation facilitates on-location operation of the device. The switch contact can be switched on and off via the control elements on the relay. The switch position is indicated simultaneously by the control element.

Manual operation facilitates on-location operation of the device. As standard, the button  Manual operation is enabled and can be switched on and off using it.

Switch on of manual operation:

Press button  until the yellow LED  lights continuously.

Switch off of manual operation:

Press button  for 1.5 seconds.

The yellow LED  continues to flash for 2 seconds.

After connection to the KNX, an ETS download or ETS reset, the device is in *KNX operation*. The LED  is off. All LEDs indicate the current state.

Note

If the *Manual operation* is generally disabled or disabled via communication object *Enable/ block manual operation*, the LED  flashes during the button push.

A switchover from *KNX operation* to the *Manual operation* mode does not occur.

Note

If manual operation is activated, the current fan speed remains set and can only be operated manually. Here any limitations, forced operations and programmed dwell times are not considered.

If manual operation is deactivated, the fan sets to a speed to which it would also be set without manual operation, e.g. via the value of the communication objects. The setting occurs with the parameterized dwell times!

2.5.1 Display elements

Indicator LEDs are located on the front of the device.

All LEDs *Output X* indicate the actual state. In *KNX operation* the LED  is off.

The response of the display elements is described in the following table:

LED	KNX operation	Manual operation
 Manual operation	Off: The device is in KNX mode Flashes: Changeover to manual mode.	On: The device is in manual mode Flashes: Changeover to KNX mode.
 Input a...c	On: Input closed. Off: Input opened.	
 Output switch contact	0: Contact open. 1: Contact closed.	
 Valve V1 HEATING	On: Valve position = 0 Off: Valve position ≠ 0 Flashing: Both valve LEDs flash at overload.	
 Valve V2 COOLING	The display indicates the same value as the 1 bit status of the valve control. With a state change the new state is immediately indicated.	
 Fan speed 1...3	On:  Fan speed 1;  Fan speed 2;  Fan speed 3 Off: Fan is off.	
 Operational display	On: Application active Off: Bus voltage failure, download or ETS reset currently under way. Flashing: Application active, internal hardware fault found. Inputs and valve outputs can no longer be controlled. Relay functional.	

2.5.2 Operating controls

Buttons for manual operation are located on the front of the device.

The behaviour of the operating controls is dependent on the operating states *KNX operation* and *Manual operation* is described in the following table:

Button	KNX operation	Manual operation
 Manual operation	<p><i>Long button push = > 1.5 s:</i> Switch to <i>Manual operation</i>, provided that <i>Manual operation</i> is not blocked by a parameter setting.</p> <p><i>Short button push = > 1.5 s:</i> LED  flashes and switches off again. The device is once again in <i>KNX operation</i>.</p>	<p><i>Long button push = > 1.5 s:</i> Changeover to the <i>KNX operation</i>. The inputs are scanned again. In this way, the input states are updated.</p> <p>Reset of the <i>Manual operation</i> to <i>KNX operation</i> can also be completed within a parameterized time depending on the parameterization.</p>
 Input a...c	No reaction	<p>By pressing the button the input is simulated. The parameterized features are carried out.</p> <p>The button can be disabled by the parameter settings.</p>
 Output A	No reaction	<p>The relay is toggled by pressing the button.</p> <p>The button can be disabled by the parameter settings.</p>
 Valve V1 HEATING	<p>A fault, e.g. due to an overload, is indicated on the device by flashing (frequency 4.8 Hz) of the corresponding LED.</p>	<p>By pressing the button <i>Opening/Closing</i> the connected valve is controlled.</p> <p>A characteristic curve adjustment is not undertaken.</p> <p>The button can be disabled by the parameter settings.</p>
 Valve V2 COOLING		
 Fan speed	No reaction	<p>By pressing the button, the individual fan speeds can be switched through. This is according to the following sequence:</p> <p>0 => 1 => 2 => 3 => 0 => 1 => 2 => 3 =>...</p> <p>The button can be disabled by the parameter settings.</p>

3 Commissioning

3.1 Overview

The application program *Fan Coil Actuator/1.0* is available for the Fan Coil Actuator. Programming requires the ETS.

The following functions are available:

Additional output	For control of auxiliary electrical heating, e.g. in the Winter ⇔ Summer transition phase.
Fan	A three speed fan is controlled alternately with a two-way connection or with speed switching.
Valve V1/2 HEATING/COOLING	One valve for HEATING and one valve for COOLING are controlled. The control of the valves can be implemented via an analogue setting signal from 0...10 V. The valve outputs are short circuit protected.
Inputs	Three binary inputs are available. These are used for example, to monitor the window contact, condensation (dew point) and signalling device.

The 6 A outputs are available for Fan Coil applications.

Caution

Improper switching will cause destruction of the fan motors.

The technical data of the fan must be observed, e.g. speed or switching function.

For further information see: [Parameter window Multi-level fan](#), page 38

The Fan Coil Actuator features relays in each output which are mechanically independent of the other outputs. Switching noises cannot be avoided due to the mechanical nature of the design.

The installation location of the Fan Coil Actuator can either be centrally in an electrical distribution board, or distributed in a Fan Coil unit. Usually, the Fan Coil Actuator is used in conjunction with a room temperature controller for an individual room temperature control system. The room temperature controller sends a control variable which is used to control the fan stages via the Fan Coil Actuator.

Fan Coil controls

- Fan with three fan speeds
- With changeover or speed control
- 2 pipe system HEATING and COOLING
- 2 pipe system HEATING or COOLING
- 3 pipe system
- 4 pipe system

For further information see: [Planning and Application](#), page 115

Configuration design types

A Fan Coil unit can be configured as a compact device or a modular installation device:

- *Compact devices:* These are supplied with enclosures and are available as self-contained units for wall or ceiling mounting.
- *Modular installation devices:* These have no enclosures and are mounted in the wall, in the ceiling or in the floor. The air is blown into the room through a grill.

Air supply

Fan Coil units are available as recirculation or as mixed air devices.

- *Recirculation devices:* The room air is directed past heat exchangers by the fans.
- *Mixed air devices:* The room air is mixed with fresh air. The mixing ratio between re-circulated and fresh air can usually be adjusted.

3.1.1

Functions of the inputs

The following table provides an overview of the functions possible with the inputs of the Fan Coil Actuator and the application program:

Functions of the inputs	a	b	c
Simplified switch sensor	■	■	■

3.1.2

Functions of the output

The following table provides an overview of the functions possible with the outputs of the Fan Coil Actuator and the application program:

Functions of the output	Output A (20 AX)
Switch function	
Normally closed contact	■
Normally open	
Time	
Staircase light	■

3.2 Parameters

The parameterization of the Fan Coil-Actuator is implemented using the Engineering Tool Software ETS. The user program can be found in the ETS at *ABB/Heating, Cooling, Blower/Fan Coil Actuator 1-fold*.

The following chapter describes the parameters of the device using the parameter window. The parameter window features a dynamic structure so that further parameters may be enabled depending on the parameterization and the function of the outputs.

The default values of the parameters are underlined, e.g.:

Options: no
 yes

3.2.1 Parameter window *General*

Higher level parameters are set in the parameter window *General*.

The screenshot shows the 'General' parameter window. On the left is a navigation tree with the following items: 'General' (selected), 'Manual operation', 'Control input', 'Fan' (with sub-items '- Status messages' and '- Automatic operation'), 'Valve 1' (with sub-item '- Function'), 'Valve 2' (with sub-item '- Function'), 'Inputs', and 'Output A'. The main area on the right contains four parameters: 'Sending and switching delay after bus voltage recovery in s [2...255]' with a value of '2'; 'Rate of telegrams' with a dropdown set to 'not limited'; 'Send object "in operation"' with a dropdown set to 'no'; and 'Enable communication object "Request status values" 1 bit' with a dropdown set to 'no'.

Sending and switching delay after bus voltage recovery in s [2...255]

Options: 2...255

Telegrams are received by the device during the sending and switching delay. The telegrams are not processed, however, and the outputs remain unchanged. No telegrams are sent on the bus.

After the sending and switching delay time, telegrams are sent and the state of the outputs is set to correspond to the parameterization or the communication object values.

If communication objects are read during the sending and switching delay, e.g. by a visualisation system, these read requests are stored and a response is sent, after the sending and switching delay has been completed.

An initialization time of about two seconds is included in the delay time. The initialisation time is the time that the processor requires to be functional.

How does the device behave with bus voltage recovery?

After bus voltage recovery, the device always waits for the sending and switching delay time to elapse before sending telegrams on the bus.

ABB i-bus[®] KNX Commissioning

Rate of telegrams

Options: not limited
 1 telegram/second
 2 telegrams/second
 3 telegrams/second
 5 telegrams/second
 10 telegrams/second
 20 telegrams/second
 0.05 seconds/telegram
 0.1 seconds/telegram
 0.2 seconds/telegram
 0.3 seconds/telegram
 0.5 seconds/telegram

A telegram limitation is implemented to control the bus load created by the device.

Send object "in operation"

Options: no
 yes

The *in operation* communication object indicates the presence of the device. This cyclic telegram can be monitored by an external device. If a telegram is not received, the device may be defective or the bus cable to the transmitting device may be interrupted.

Note
After bus voltage recovery the communication object is sent after the set sending and switching delay.

- yes: The communication object *in operation* is not enabled. The following parameters appear:

Telegram repeated s [1...65,535]

Options: 1...60...65,535

This parameter determines the time interval, at which the communication object *in operation* cyclically sends a telegram.

Send value cyclically

Options: 1
 0

This parameter defines the value that the communication object sends on the bus.

Enable communication object "Request status values" 1 bit

Options: no
 yes

Via this communication object, all status messages can be requested, provided that they have been parameterized with the option *after a change or request*.

- *yes*: A 1 bit communication object *Request status values* is enabled. The following parameter appears.

recall with object value

Options: 0
 1
 0 or 1

- *0*: The status messages are requested with the value 0.
- *1*: The status messages are requested with the value 1.
- *0 or 1*: The status messages are requested with the values 0 or 1.

3.2.2 Parameter window *Manual operation*

In the parameter window, all the settings for manual operation can be made.

General	Manual operation	enabled
Manual operation	Reset manual operation to EIB/KNX operation	no
Control input	Enable communication object "Status man. operation" 1 bit	yes
Fan	Send object value	after a change
- Status messages	Function of the buttons:	
- Automatic operation	Speed	enabled
Valve 1	Valve Heating	enabled
- Function	Valve Cooling	enabled
Valve 2	Input a	Switch
- Function	Input b	Switch
Inputs	Input c	Switch
Output A	Output A	enabled

Manual operation

Options: enabled
enable/disable via communication object
disabled

This parameter defines if the switch over between the operating states *Manual operation* and *KNX operation* is enabled or disabled via the button  on the device or via a communication object.

- *enabled*: The operating states *Manual operation* and *KNX operation* can be toggled via button .
- *enable via communication object* The communication object *Enable manual operation* – manual operation (No. X) appears.
- *disabled*: Manual operation is generally disabled.

Telegram value 0 = enable button 
 1 = block button 

For further information see: [Manual operation](#), page 17.

Note

The manual operation overwrites the input states.

Reset manual operation to EIB/KNX operation

Option: no
after 1/3/10/30 minute(s)

This parameter determines how long the device remains in the *Manual operation* mode after pressing the button .

- *no*: The device remains in *Manual operation* until the button  is pressed again.
- *after 1/3/10/30 minute(s)*: The device remains in *Manual operation* after the last button push until either button  is pushed again or the programmed time has timed out.

Enable communication object "Status man. operation" 1 bit

Options: no
yes

- *yes*: The 1 bit communication object *Status of manual operation* (no. X) is enabled. An additional parameter appears:

Send object value

Options: no, update only
after a change
after request
after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

For further information see: [Manual operation](#), page 17

Function of the buttons:

Speed

Options: enabled
 disabled

With this parameter the button can also be enabled or disabled.

- *enabled*: The button is enabled.
- *disabled*: The button is disabled.

Note
The Valve HEATING corresponds with valve V1 The Valve COOLING corresponds with valve V2

Valve Heating

Options: enabled
 disabled

With this parameter the button  can be enabled or disabled .

- *enabled*: The buttons are enabled.
- *disabled*: The buttons are disabled.

Valve Cooling

The operation of the COOLING valve does not differ from the operation of the HEATING valve.

For further information see: Parameter description [Valve HEATING](#), page 67

Input a

This parameter is visible if in [Parameter window Input](#), page 75, with parameter *Input a* the option *Switch sensor/fault monitoring input* has been selected.

Options: Block
 Switch
 Buttons

With this parameter the button can be disabled, or programmed as a switch or push button.

- *Block*: The button is disabled.
- *Switch*: With every actuation the states of the input and the LED are changed.
- *Push buttons*:
 - Press button => input closed, LED on
 - Release button => input opened, LED off

Input b...c

The operation of inputs b...c does not differ from the operation of input a.

Output A

Options: enabled
 disabled

With this parameter, the button can be enabled or disabled.

- *enabled*: The button is enabled.
- *disabled*: The button is disabled.

3.2.3 Parameter window *Control input*

In this parameter window, all settings for the *Control input* are undertaken.

General	HVAC-System	1 Control value/2-pipe
Manual operation	Valve cooling independently usable	< - Note
Control input	Operation heat/cool after bus voltage recovery	unchanged
Fan	Monitoring control values e.g. thermostat	no
- Status messages		
- Automatic operation		
Valve 1		
- Function		
Valve 2		
- Function		
Inputs		
Output A		

HVAC-System

Options:

- [1 Control value/2-pipe](#)
- [1 Control value/4-pipe, with switching object](#)
- [2 Control values/2-pipe](#)
- [2 Control values/2-pipe, with switching object](#)
- [2 Control values/4-pipe](#)

This parameter defines the pipe system, which is used with the Fan Coil Actuator. The individual functions are described in the following chapters.

Important

If a valve is deactivated due to a conversion of the HVAC system, the valve will be fully closed. A correction curve which may be set will be ignored!

Monitoring control values e.g. thermostat

Options: no
yes

- yes: The communication object *Fault control value* is enabled. Hereby for example, a thermostat can be cyclically monitored.

With option yes , the following parameters appear:

Monitoring time in s

[30...65,535]

Options: 30...120...65,535

With this parameter, the time is set with which all telegrams on the input/setting values of the FCA/S are monitored: Communication objects *Control value*, *HEATING*, *Control value*, *COOLING*, *Control value HEATING/COOLING* or *Toggle*, *HEATING/COOLING*.

If a setting variable is not received within the parameterized time, a communication malfunction has occurred and emergency operation is activated.

Important
It must be assured that the monitoring time is set to at least factor 3 larger than the set sending time of the thermostat.

The reaction of the FCA/S to a setting value not received can be defined in the following parameters.

Send object value

(Object "Control value fault" 1 bit)

Options: no, update only
after a change
after request
after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Control value after control fault in % [0...100]

Options: 0...30...100

This parameter sets the control value in % with which the valve is set in emergency operation, e.g. should the control fail.

3.2.3.1 HVAC system – 1 Control value/2-pipe

If option 1 *Control values/2-pipe* is selected, then further parameters appear:

Note
The Valve HEATING corresponds with valve V1 The Valve COOLING corresponds with valve V2

Valve cooling independently usable

This parameter serves as a note or remark.

Valve Cooling

The cooling valve can be used additionally and independently via the communication object *Control value COOLING(extra!)*. The valve V2 COOLING is not monitored in the process.

Valve HEATING

Via communication object *Control value HEATING/COOLING*, the valve V1 HEATING and the fan are controlled.

For further information see: [Configuration of a HVAC system with Fan Coil units](#), page 117

Operation heat/cool after bus voltage recovery

Options: unchanged
 Heating
 Cooling

Using this parameter, the reaction after bus voltage recovery is set.

- *unchanged*: After bus voltage recovery, the state which existed before bus voltage failure is set.
- *Heating*: After bus voltage recovery, the *HEATING* state is set.
- *Cooling*: After bus voltage recovery, the *COOLING* state is set.

3.2.3.2 HVAC-System – 1 Control values/4-pipe, with switching object

If option *1 Control value/4-pipe with switching object* is selected, further parameters appear:

Toggle Heating/Cooling via object

This parameter serves as a note or remark.

Note
The Valve HEATING corresponds with valve V1
The Valve COOLING corresponds with valve V2

Valve HEATING/COOLING

Using communication object *Control value HEATING/COOLING*, the valves V1/V2 HEATING/COOLING and the fans are controlled.

Toggle between HEATING and COOLING is implemented via the communication object *Toggle HEATING/COOLING*.

The corresponding inactive/non-actuated valve is thus automatically closed when toggled.

For further information see: [Configuration of a HVAC system with Fan Coil units](#), page 117

Operation heat/cool after bus voltage recovery

Options: unchanged
Heating
Cooling

Using this parameter, the reaction after bus voltage recovery is set.

- *unchanged*: After bus voltage recovery, the state which existed before bus voltage failure is set.
- *Heating*: After bus voltage recovery, the *HEATING* state is set.
- *Cooling*: After bus voltage recovery, the *COOLING* state is set.

Object value for heating the object "Toggle heating/cooling"

Options: $\frac{1}{0}$

With this parameter, you set the communication object value used to toggle between HEATING and COOLING.

- *1*: As soon as a telegram with the value 1 is received, HEATING is activated and COOLING is deactivated.
- *0*: As soon as a telegram with the value 0 is received, HEATING is activated and COOLING is deactivated.

3.2.3.3 HVAC system – 2 Control value/2-pipe

If option 2 *Control values/2-pipe* is selected, then further parameters appear:

Toggle Heating/Cooling via automatically controlled value

This parameter serves as a note or remark.

Note

The Valve HEATING corresponds with valve V1
The Valve COOLING corresponds with valve V2

Valve HEATING/Valve COOLING

Toggle between HEATING and COOLING is implemented by updating the control values. The HEATING/COOLING status is then set accordingly.

Note

The switchover between HEATING/COOLING should occur exclusively in the respective thermostat. Here only HEATING or COOLING is always active depending on the last control value received.

- If a control with a value > 0 is received, the fan and the corresponding valve are controlled.
- The other valve is closed.
- If a control value with a value = 0 is received, this is ignored if the other control value > 0.

Caution

With a 2-pipe HVAC system, both the *Control value HEATING* as well as the *Control value COOLING* act on the valve V1 HEATING (electronic outputs O, P). Please note that the last control value received always controls the valve V1 HEATING.

For 2 pipe systems, only the communication objects for the valve V1 HEATING are relevant.

The communication objects in conjunction with the valve V2 COOLING, e.g. status, forced operation or valve purge are not effective.

For further information see: [Configuration of a HVAC system with Fan Coil units](#), page 117

Operation heat/cool after bus voltage recovery

Options: unchanged
Heating
Cooling

Using this parameter, the reaction after bus voltage recovery is set.

- *unchanged*: After bus voltage recovery, the state which existed before bus voltage failure is set.
- *Heating*: After bus voltage recovery, the *HEATING* state is set.
- *Cooling*: After bus voltage recovery, the *COOLING* state is set.

3.2.3.4 HVAC-System – 2 Control values/2-pipe, with switching object

If option 2 *Control value/2-pipe with switching object* is selected, further parameters appear:

Toggle Heating/Cooling via object

This parameter serves as a note or remark.

Note

The Valve HEATING corresponds with valve V1
The Valve COOLING corresponds with valve V2

Valve HEATING/Valve COOLING

The valve is controlled via the communication object *Control value HEATING*.

Toggle between HEATING and COOLING is implemented via the communication object *Toggle HEATING/COOLING*.

Caution

With a 2-pipe HVAC system, both the *Control value HEATING* as well as the *Control value COOLING* act on the valve V1 HEATING (electronic outputs O, P). Please note that always the last control value received and the switching object control the HEATING valve.
For 2 pipe systems, only the communication objects for the valve V1 HEATING are relevant.
The communication objects in conjunction with the valve V2 COOLING, e.g. status, forced operation or valve purge are not effective.

For further information see: [Configuration of a HVAC system with Fan Coil units](#), page 117

Operation heat/cool after bus voltage recovery

Options: unchanged
HEATING
COOLING

Using this parameter, the reaction after bus voltage recovery is set.

- *unchanged*: After bus voltage recovery, the state which existed before bus voltage failure is set.
- *Heating*: After bus voltage recovery, the *HEATING* state is set.
- *Cooling*: After bus voltage recovery, the *COOLING* state is set.

Object value for heating the object "Toggle heating/cooling"

Options: $\frac{1}{0}$

With this parameter, you set the communication object value used to toggle between HEATING and COOLING.

- *1*: As soon as a telegram with the value 1 is received, HEATING is activated and COOLING is deactivated.
- *0*: As soon as a telegram with the value 0 is received, HEATING is activated and COOLING is deactivated.

3.2.3.5 HVAC system – 2 Control values/4-pipe

If option 2 *Control values/4-pipe* is selected, then further parameters appear:

Toggle Heating/Cooling via automatically controlled value

This parameter serves as a note or remark.

Note
The Valve HEATING corresponds with valve V1 The Valve COOLING corresponds with valve V2

Valve HEATING/Valve COOLING

The HEATING valve V1 is controlled via the communication object *Control value HEATING*.

The COOLING valve V2 is controlled via the communication object *Control value COOLING*.

Toggle between HEATING and COOLING is implemented by updating the control values. The HEATING/COOLING status is then set accordingly.

Note
The switchover between HEATING/COOLING should occur exclusively in the respective thermostat. Here only HEATING or COOLING is always active depending on the last control value received. <ul style="list-style-type: none">• If a control with a value > 0 is received, the fan and the corresponding valve are controlled.• The other valve is closed.• If a control value with a value = 0 is received, this is ignored if the other control value > 0.

For further information see: [Configuration of a HVAC system with Fan Coil units](#), page 117

Operation heat/cool after bus voltage recovery

Options: unchanged
Heating
Cooling

Using this parameter, the reaction after bus voltage recovery is set.

- *unchanged*: After bus voltage recovery, the state which existed before bus voltage failure is set.
- *Heating*: After bus voltage recovery, the *HEATING* state is set.
- *Cooling*: After bus voltage recovery, the *COOLING* state is set.

3.2.4 Parameter window *Multi-level fan*

In this parameter window, all settings for the *Multi-level fan* are undertaken.

General	Fan type	multi-level
Manual operation	Speed on 2 limit	no
Control input	Fan Operation Mode note technical data of Fan !!!	Changeover switch
Fan	Delay between fan speed switching in ms [50...5,000]	500
- Status messages	Fan speed on bus voltage failure	unchanged
- Automatic operation	Fan speed on bus voltage recovery	unchanged
Valve 1	Enable communication object "Forced operation" 1 bit	no
- Function		
Valve 2		
- Function		
Inputs		
Output A		
	Enable automatic operation	yes
	Enable direct operation	no
	Starting characteristic of fan	no

Fan type

Option: multi-level
one-level

This parameter defines the fan type which is to be controlled.

- *multi-level*: A fan with up to three speeds is controlled.
- *one-level*: A fan with one speed should be controlled.

Speed on 2 limit

Option: no
yes

The fan speeds can be limited to two here. The following settings are the same as those for a three speed fan, but are only limited to two speeds.

- *no*: A three speed fan is controlled.
- *yes*: A two speed fan is controlled via fan speeds 1 and 2. Fan speed 3 is non-functional.

Fan Operation Mode note techn. Data of Fan !!!

Option: Changeover switch
Step switch

The control of the fan is set with this parameter. The mode of fan control should be taken from the technical data of the fan.

How does a two-way changeover circuit function?

Only the corresponding output of the assigned fan speed is switched on with the parameterization as a changeover switch.

The delay time between the stage switch over and a minimum dwell time in a valve stage are programmable. The minimum dwell time in a fan speed is only active in automatic mode.

How does speed switching function?

With step switch control, no erratic and sudden switch on of the fan is possible. The individual fan speeds are activated consecutively (outputs switched on) until the required fan speed is achieved.

The parameterized delay time between two fan speeds has the effect that the current fan speed must be switched on for at least this time before the next valve speed is switched on. The parameterized minimum dwell time in a fan speed has the same effect as a changeover switch, i.e. it is only active in automatic mode and is added to the switchover delay.

- *Changeover switch:* The following parameter appears:

Delay between fan speed switching in ms [50...5,000]

Option: 50...500...5,000

A switchover delay can be programmed with this parameter. As this time is a fan specific factor, it is always considered.

Fan speed on bus voltage failure

Option: unchanged
off

Fan speed on bus voltage recovery

Options: unchanged
off
1
2
3

- *unchanged:* The fan speeds of the fan remain unchanged.
- *off:* The fan is switched off.
- *1, 2 or 3:* The fan switches to fan speed 1, 2 or 3.

Caution

The FCA/S is supplied ex-works with a default setting (factory default). This ensures the fan setting is switched off when the bus voltage is applied to the relay for the first time. Thus, damage to the device due to unintentional switch on during transport, e.g. due to vibration, is avoided.

It is advisable to apply a bus voltage before connecting the fan in order to achieve a defined switch state of the fan. This eliminates the possibility of the destruction of the fan due to an incorrect contact setting.

Enable communication object "Forced operation" 1 bit

Options: no
yes

Through forced operation for example, a recirculation: Valve OFF and fan ON can be implemented.

- yes: A 1 bit communication object *Forced operation* is enabled. The following parameters appear at the same time:

Forced operation on object value

Options: $\frac{1}{0}$

- 1: Forced operation is activated by a telegram with value 1.
- 0: Forced operation is activated by a telegram with value 0.

Note

During forced operation, the settings set in *Automatic operation* are ignored. Automatic operation is updated after forced operation has been rescinded.

Important

Forced operation remains active until:

- the complementary set values are sent.
- the assignment is changed.
- the fan type is changed.

The forced operation is not deactivated by a download of the application program, in which the fan type and the respective group addresses are retained.

The forced operation is reset if an ETS reset has occurred.

Limitation with forced operation

Options: 3, 2, 1, off
unchanged
off
1
1, off
2
2, 1
2, 1, off
3
3, 2
3, 2, 1

This parameter sets which fan speed is set with active forced operation or which may not be exceeded or undershot.

- 3, 2, 1, off Everything is possible.
- *unchanged*: The state is retained.
- Off: Off.
- 1: limited to speed 1.*
- 1, off limited to speed 1 and off.
- 2: limited to speed 2.*
- 2, 1: limited to speed 2 and 1.
- 2, 1, off: limited to speed 2, 1 and off.
- 3: limited to speed 3.*
- 3, 2: limited to speed 3 and 2.
- 3, 2, 1: limited to speed 3, 2 and 1.

* The control value is ignored.

Enable automatic operation

Options: no
yes

- *yes*: *Automatic operation* is enabled. Furthermore, the [Parameter window - Automatic operation](#), page 49 appears.

Enable direct operation

Options: no
yes

- *yes*: *Direct operation* is enabled. Furthermore, the [Parameter window - Direct operation](#), page 55 appears.

Starting characteristic of fan

Options: no
 yes

This parameter enables the fan to start from the OFF state with a defined fan speed. This fan stage is immediately applied.

In order to guarantee a safe start of the fan motor, it can be useful to start the fan motor first with a higher fan speed. Thus, a higher torque for the start up phase of the fan is achieved.

Note
A step switch normally means however that the previous fan stages are usually switched on consecutively. With the changeover switch, the fan speed is directly switched on.

The delay between the switchover of two fan speeds (contact change) is considered.

The dwell times in a fan speed, which are considered in automatic mode, are inactive and will only be considered after the start up phase.

The start-up behaviour is a technical characteristic of the fan. For this reason, this behaviour has a higher priority than an active limitation or forced operation.

With the option *yes* in the parameter *Starting characteristic of fan*, the two additional parameters appear:

Switch on over fan speed

Options: 1/2/3

Here you set which fan stage the fan uses to start from the OFF state.

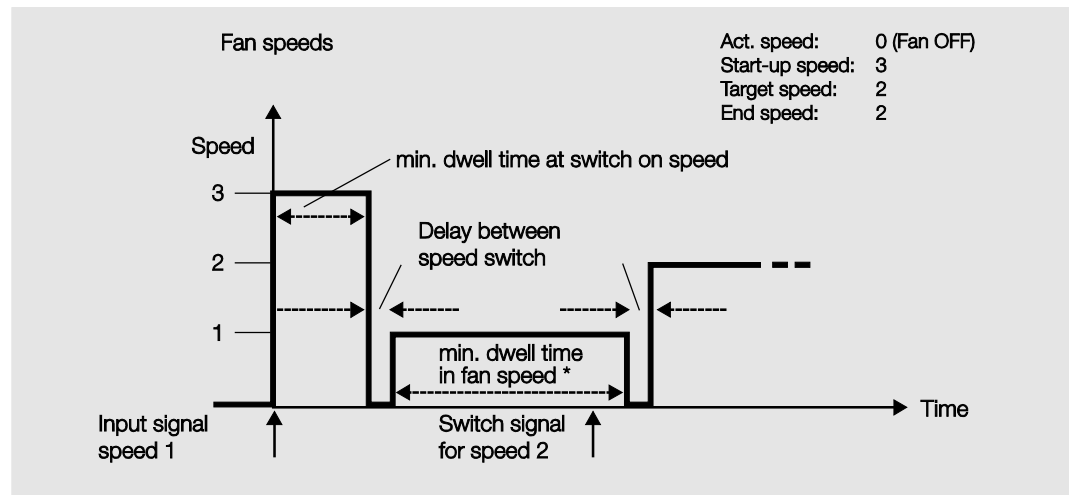

Minimum dwell period in switch on fan speed in s [1...65,535]

Options: 1...5...65,535

This parameter defines the length of the minimum dwell time in a switch on speed.

Example: Starting characteristic of a three speed fan

The illustration shows the response in automatic operation with the option *Switch on over fan speed* 3, if the fan receives the telegram from the OFF state to set *Speed 1*.

* The parameter *Minimum dwell period in fan speed in s [0...65,535]* in the parameter window *Automatic operation* is only active and programmable, if the option *yes* has been selected in the parameter *Enable automatic operation*. In the parameter window *Fan*, you can find the parameter *Enable automatic operation*.

Important

The forced operation remains valid and is considered.

The parameterized minimum dwell time in the fan speed for automatic mode is ignored during manual operation. Accordingly, an immediate reaction to the manual operation is detected.

The delay time with speed switch over remains active to protect the fan.

3.2.4.1

Parameter window - *Status messages*

In this parameter window, the *Status messages* are defined.

General	Enable communication object "Status fan speed x" 1 bit	no
Manual operation		
Control input		
Fan		
- Status messages		
- Automatic operation	Enable communication object "Status fan speed" 1 byte	no
Valve 1		
- Function		
Valve 2		
- Function		
Inputs	Enable communication object "Status byte mode" 1 bit	no
Output A		
	Enable communication object "Status Fan On/Off" 1 bit	no
	Enable communication object "Status automatic" 1 bit	no

Enable communication object "Status fan speed x" 1 bit

Options: no
yes

The setting of a fan speed is displayed via these communication objects. You can parameterize the status to indicate a current fan speed or a required fan speed.

- yes: Three 1 bit communication objects, *Status fan speed x*, $x = 1$ to 3 are enabled. The following parameters appear:

Meaning

Options: current fan speed
required fan speed

This parameter defines whether the status of the *current fan speed* or the *required fan speed* is displayed.

What is the current fan speed?

The *current fan speed* is the speed at which the fan is actually operating.

What is the required fan speed?

The *required fan speed* is the fan speed which has to be achieved, e.g. when the transition and dwell times are completed.

Note

The limitations are included in this observation, i.e. if a limitation allows only fan speed 2 and the fan is operating at fan speed 2, and for example, a telegram to *switch up* is received, the required fan speed remains at 2 as fan speed 3 cannot be achieved due to the limitation.

Send object values

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Enable communication object "Status fan speed" 1 byte

Options: no
 yes

This status byte defines the figure value of the fan speed.

This display can be differentiated with the selection of *current fan speed* from the *required fan speed*. Initially, the switchover times, dwell times and the start-up phase must be completed before the required fan speed is achieved.

- yes: The communication object *Status fan speed* is enabled.

What is the current fan speed?

The *current fan speed* is the speed at which the fan is actually operating.

What is the required fan speed?

The *required fan speed* is the fan speed which has to be achieved, e.g. when the transition and dwell times are completed.

With option yes the following parameters appear:

Meaning

Options: current fan speed
required fan speed

This parameter defines whether the status of the *current fan speed* or the *required fan speed* is displayed.

Note

The limitations are included in this observation, i.e. if a limitation allows only fan speed 2 and the fan is operating at fan speed 2, and for example, a telegram to *switch up* is received, the required fan speed remains at 2 as fan speed 3 cannot be achieved due to the limitation.

used datapoint type

Optionen: DPT 5.010 (step value 0...n)
DPT 5.001 (percent value 0...100 %)

With this parameter, you set the datapoint type for the communication object *Fan speed switch*.

Send object value

Options: no, update only
after a change
after request
after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Enable communication object "Status byte mode" 1 byte

Options: no
yes

From this status byte, the states HEATING, COOLING, automatic, forced operation and the four limitations are indicated directly via a 1 bit coding.

For further information see: [Status byte forced/operation](#), page 146

- yes: The communication object *Status byte* mode is enabled. The following parameter appears:

Send object values

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Enable communication object "Status Fan On/Off" 1 bit

Options: no
 yes

The communication object *Status fan* can be enabled with this parameter.

Some fans must receive an ON telegram before they are set to a fan speed from the OFF state. This ON telegram acts on a main switch which has to be switched on. This demand can be implemented with any switch output which is controlled via the *Status fan* communication object. The corresponding switch communication object of the switch actuator should be connected with the *Status fan* communication object.

With the option yes, the following parameters appear:

Send object value

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

The following parameter only becomes visible if the option yes has been selected in the *Enable automatic operation* parameter in the *Fan* parameter window.

Enable communication object "Status automatic" 1 bit

Options: no
 yes

The communication object *Status automatic* is enabled with this parameter.

Telegram value 1 = FCA/S is in automatic operation.
 0 = automatic operation switched off

- yes: The following parameter appears:

Send object value

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

3.2.4.2 Parameter window - Automatic operation

This parameter window is visible if in parameter window *Fan*, the option *Enable automatic operation* has been selected with the option yes.

The screenshot shows the 'Automatic operation' parameter window. On the left is a navigation tree with the following items: General, Manual operation, Control input, Fan, - Status messages, - Automatic operation (highlighted), Valve 1, - Function, Valve 2, - Function, Inputs, and Output A. The main area displays several parameters with their current values and input fields:

- Object value "automatic On/Off" switch on to the automatic: 1 (dropdown menu)
- Threshold value OFF <-> speed 1 in % [1...100]: 10 (input field)
- Threshold value 1 <-> speed 2 in % [1...100]: 30 (input field)
- Threshold value 2 <-> speed 3 in % [1...100]: 70 (input field)
- Hysteresis threshold value in % +/- [0...20]: 5 (input field)
- Minimum dwell period in fan speed in s [0...65,535]: 0 (input field)
- Enable limitations: no (dropdown menu)

In this parameter window, the threshold values for switchover of the fan speed are defined. Furthermore, the limitations can also be enabled.

Important

The Fan Coil Actuator evaluates the threshold values in ascending order, i.e. first of all the threshold value for *OFF <-> Fan speed 1* is checked followed by *Fan speed 1 <-> Fan speed 2* etc. The correct method of function is only assured if the threshold value for *OFF <-> Fan speed 1* is less than the threshold value *Fan speed 1 <-> Fan speed 2* and this is less than *Fan speed 2 <-> Fan speed 3*, etc.

Object value "automatic On/Off" switch on to the automatic

Options: $\frac{1}{0}$

This parameter defines how to react to a telegram.

- 1: Automatic is activated by a telegram with value 1.
- 0: Automatic is activated by a telegram with value 0.

Threshold value OFF <-> speed 1 in %

[1...100]

Options: 1...10...100

Here the threshold value is set, at which switch on of fan speed 1 occurs. If the value in the control value communication object is greater than the parameterized threshold value, fan speed 1 is switched on. If the value is less, than it is switched off.

Threshold value speed 1 <-> speed 2 in %

[1...100]

Options: 1...30...100

Here the threshold value, at which switch over to fan speed 2 occurs, is set. If the value in the communication object *Control value HEATING* or *Control value COOLING* is greater than the parameterized threshold value, switch over to fan speed 2 occurs.

Threshold value speed 2 <-> speed 3 in %

[1...100]

Options: 1...70...100

Here the threshold value, at which switch over to fan speed 3 occurs, is set. If the value in the communication object *Control value HEATING* or *Control value COOLING* is greater than the parameterized threshold value, switch over to fan speed 3 occurs.

Hysteresis

threshold value in % +/- [0...20]

Options: 0...5...20

Here a hysteresis is set at which switchover to the next fan speed occurs. The hysteresis applies for all three threshold values.

The setting 0 causes immediate switching without hysteresis.

The entered percentage value is directly added to or subtracted from the percentage value of the *Fan speed x threshold value x*. The result is a new upper or lower threshold value.

Switch threshold top (switch on) = threshold value + hysteresis

Switch threshold bottom (switch off) = threshold value - hysteresis

Example: Three speed fan, hysteresis with fan control

Using hysteresis, a continuous switching between the fan speeds around the threshold value with deviating input signals can be avoided.

Important

How does the fan react if the switch thresholds overlap by the use of hysteresis?

- 1) The hysteresis defines from which point the set speed transition occurs.
- 2) If the speed transition occurs, the new speed is determined using the control value and the set switch thresholds. The hysteresis is not considered.

A control variable with the value 0 always results in speed 0.

An example:

Parameterized: Threshold value OFF <-> speed 1 = 10 %
 Threshold value 1 <-> speed 2 = 20 %
 Threshold value 2 <-> speed 3 = 30 %
 Hysteresis 15 %

Behaviour when ascending from speed 0:

- Speed 0 transition at 25 % ($\geq 10 \% + \text{hysteresis}$).
- The new speed is 2 (25 % is between 20 and 30 %).
- Accordingly, speed 1 is omitted.

Behaviour when descending from speed 3:

- Speed 3 transition at 14 % ($< 30 \% - \text{hysteresis}$).
- The new speed is 1 (15 % is between 10 and 20 %).
- Accordingly, speed 2 is omitted.

Minimum dwell period in fan speed in s [0...65,535]

Options: 0...30...65,535

This parameter defines the dwell time for a fan speed of the fan until it switches to the next higher or lower fan speed. The input is made in seconds.

A setting of 0 means non-delayed switching. The minimum switch times of the relay can be found in the [Technical data](#), page 7.

The dwell time in a fan stage is only considered in automatic mode.

Enable limitations

Option: no
yes

- yes: Other parameters appear.

At the same time, 4 communication objects for limitation of the fan speed are enabled:

- *Limitation 1*, e.g. for frost/heat protection
- *Limitation 2*, e.g. for comfort operation
- *Limitation 3*, e.g. for night shutdown
- *Limitation 4*, e.g. for standby operation

Speed ranges (limitations) are defined for the fan with the function *Speed limitation* which may not be exceeded or undershot.

Four limitations are available. They can be used, for example, for the control of various operating modes, e.g. frost/heat protection, comfort, night shut down and standby. In normal cases, the thermostat takes these operating modes into account in its control variable for the actuator.

Important

The parameterized starting behaviour, which is a technical characteristic of the fan, has a higher priority than a limitation or forced operation, i.e. if a limitation is activated in fan speed 2 and a start-up behaviour is parameterized via fan speed 3, the following behaviour will result: The fan is in the OFF state and receives a control signal for fan speed 1. Initially, the fan operates at fan speed 3 (start-up speed) and then proceeds to fan speed 2 that is defined by the limitation. The actual required fan speed 1 will not be achieved due to the limitation.

The sequence of the displayed parameters corresponds with their priorities, i.e. the parameter with the highest priority has limitation 1 followed by limitation 2, 3 and 4.

Note

The fault operation, e.g. as with a malfunction of the thermostat has a lower priority than the fan limitation, i.e. by a limitation of the fan speed during a thermostat malfunction only the upper or the lower limit of the fan limitation can be set at best.

When automatic mode is exited, e.g. by a manual action, the limitations 1 to 4 are inactive.

The set limitations are reactivated after automatic operation is reactivated.

The following points apply for limitations:

- The fan speed and valve position can be parameterized independently.
- The limitation need not necessarily apply to one fan speed only. It can also encompass another range of the fan speeds, i.e. only certain fan speeds can be set if the limitation is active. In this way, a limited control is also possible.
- The Limitation is activated if a telegram with the value 1 is received on the communication object *Limitation x*. The limitation is deactivated if a telegram with the value 0 is received on the communication object *Limitation x*. A manual action ends automatic mode.
- If a limitation is activated, the Fan Coil Actuator switches to the parameterized fan speed regardless of the control value. If during the activation of the limitation another fan stage or a fan stage outside the range of the "limitation range" is set, the required fan stage or the limit fan stage of the range is set.
- After switch off of the limitations, the fan speed and the communication objects for valve control are recalculated and executed, This means that during limitation the actuator operates normally in the background, the outputs are not changed and implementation only occurs after the end of limitation.

There are the same parameters for each of the individual four limitations used to limit the fan speeds.

Important
The priority is according to the listed sequence. The highest priority is assigned to limitation 1, e.g. Frost/Heat protection; the lowest priority is assigned to limitation 4, e.g. standby operation.

Speed with limitation 1

Speed with limitation 2

Speed with limitation 3

Speed with limitation 4

Options: 3, 2, 1, off
 unchanged
 off
 1
 1, off
 2
 2, 1
 2, 1, off
 3
 3, 2
 3, 2, 1

With this parameter, you set which fan speed is set with active limitation or which speed is not exceeded or undershot.

- *3, 2, 1, off*: Everything is possible.
- *unchanged*: The state is retained.
- *Off*: Off.
- *1*: limited to speed 1.*
- *1, off*: limited to speed 1 and off.
- *2*: limited to speed 2.*
- *2, 1*: limited to speed 2 and 1.
- *2, 1, off*: limited to speed 2, 1 and off.
- *3*: limited to speed 3.*
- *3, 2*: limited to speed 3 and 2.
- *3, 2, 1*: limited to speed 3, 2 and 1.

* The control value is ignored.

3.2.4.3 **Parameter window - *Direct operation***

This parameter window is visible if in parameter window *Fan*, the option *Enable direct operation* has been selected with the option *yes*.

General	Enable communication object "Switch speed x" 1 bit	no
Manual operation		
Control input		
Fan	Enable communication object "Fan speed up/down" 1 bit	no
- Status messages		
- Automatic operation		
- Direct operation	Enable communication object "Fan speed switch" 1 byte	no
Valve 1		
- Function		
Valve 2		
- Function		
Inputs		
Output A		

**Enable communication object
"Switch speed x" 1 bit**

Options: no
 yes

- yes: Three 1 bit communication objects *Speed 1*, *Speed 2* and *Speed 3* are enabled.

The FCA/S receives a setting telegram via these communication objects and switches off automatic operation.

Telegram value 1 = Fan speed x is switched on
 0 = Fan speed x is switched on

If several ON/OFF telegrams are received consecutively in a short period of time at various communication objects *Fan speed 1...3*, the value last received by the fan control is the decisive value. An OFF telegram to one of the three communication objects, *Fan speed 1...3*, switches off the fan completely.

Important
The forced operation remains valid and is considered.
The parameterized minimum dwell time in the fan speed for automatic mode is ignored during manual operation. Accordingly, an immediate reaction to the manual operation is detected.
The delay time with speed switch over remains active to protect the fan.

Enable communication object

"Fan speed up/down" 1 bit

Options: no
 yes

- yes: A communication object 1 bit *Fan speed UP/DOWN* is enabled.

Telegram value 1 = a fan speed is switched UP
 0 = a fan speed is switched DOWN

If the maximum fan speed is achieved and a further telegram with the value 1 is received the fans speed will remain as it is.

Important

The forced operation remains valid and is considered.

The parameterized minimum dwell time in the fan speed for automatic mode is ignored during manual operation. Accordingly, an immediate reaction to the manual operation is detected.

The delay time with speed switch over remains active to protect the fan.

With multiple manual UP or DOWN switching, the target speed will be increased or reduced by a speed step. This is possible until the maximum or minimum possible speed is achieved. Further UP or DOWN telegrams are ignored and not executed. Each new switching telegram initiates a new calculation of the target speed. This means that the target speed can be changed by switching telegrams until the target speed is achieved.

Enable communication object

"Fan speed switch" 1 byte

Options: no
 yes

- yes: A 1 byte communication object *Switch speed* is enabled.

used datapoint type

Optionen: DPT 5.010 (step value 0...n)
 DPT 5.001 (percent value 0...100 %)

With this parameter, you set the datapoint type for the communication object *Fan speed switch*. .

3.2.5 **Parameter window *Two level fan***

In this parameter window, all settings for the *Two-level fan* are undertaken.

General	Fan type	multi-level
Manual operation	Speed on 2 limit	yes
Control input	Fan Operation Mode note technical data of Fan !!!	Changeover switch
Fan	Delay between fan speed switching in ms [50...5,000]	500
- Status messages	Fan speed on bus voltage failure	unchanged
- Automatic operation	Fan speed on bus voltage recovery	unchanged
Valve 1	Enable communication object "Forced operation" 1 bit	no
- Function		
Valve 2		
- Function		
Inputs		
Output A		
	Enable automatic operation	yes
	Enable direct operation	no
	Starting characteristic of fan	no

If a fan with two fan speeds is to be controlled via the FCA/S, the following parameters must be set:

- Select the option *multi-level* with parameter *Fan type* in the parameter window *Fan*.
- For parameter *Speed on 2 limit*, the option *yes* must be selected.

Now a two speed fan is controlled via fan speeds 1 and 2.

Fan speed 3 with all its parameters and options is now non-functional.

Note
Further parameters and their settings can be found in Parameter window Multi-level fan , page 38.

3.2.6 Parameter window *One-level fan*

In this parameter window, all settings for the *one-level fan* are undertaken.

General	Fan type	one-level ▼
Manual operation	Fan speed on bus voltage failure	unchanged ▼
Control input	Fan speed on bus voltage recovery	unchanged ▼
Fan	Enable communication object "Forced operation" 1 bit	no ▼
- Status messages		
Valve 1		
- Function		
Valve 2		
- Function		
Inputs	Enable automatic operation	no ▼
Output A	Time function on ON	none ▼
	Time function on OFF	none ▼

Fan type

Option: multi-level
one-level

The fan type to be controlled is set with this parameter.

If a fan with up to three speeds is to be controlled, the option *multi-level* must be selected.

If a fan with one speed is to be controlled, the option *one-level* must be selected.

Fan speed on bus voltage failure

Option: unchanged
off
on

The behaviour of the fan on bus voltage failure is defined here.

Fan speed on bus voltage recovery

Options: unchanged
 off
 on

The behaviour of the fan on bus voltage recovery is defined here.

- *unchanged*: The fan speed of the fan remains unchanged.
- *Off*: The fan is switched off.
- *On*: The fan is switched on.

Caution

The FCA/S is supplied ex-works with a default setting (factory default). This ensures the fan setting is switched off when the bus voltage is applied to the relay for the first time. Thus, damage to the device due to unintentional switch on during transport, e.g. due to vibration, is avoided.

It is advisable to apply a bus voltage before connecting the fan in order to achieve a defined switch state of the fan. This eliminates the possibility of the destruction of the fan due to an incorrect contact setting.

Enable communication object "Forced operation" 1 bit

Options: no
 yes

- *yes*: A 1 bit communication object *Forced operation* is enabled. The following parameters appear at the same time:

Forced operation on object value

Options: $\frac{1}{0}$

- *1*: Forced operation is activated by a telegram with value 1.
- *0*: Forced operation is activated by a telegram with value 0.

Behaviour with forced operation

Options: unchanged
 off
 on

This parameter defines how the fan should respond with forced operation.

Enable automatic operation

Options: no
 yes

- yes: Automatic mode is enabled; an additional parameter window *Automatic operation* appears.

Time function on ON

Options: none
 switching delay
 minimum time

The function *Time* at fan ON is defined here with this parameter.

- *none*: No function *Time* is executed.
- *switching delay*: The fan is switched on using this delay.
- *minimum time*: The fan remains ON for at least this time.

With option *switching delay*, the following parameters appear:

Time in s [1...65,535 x 0.1]

Options: 1...20...65,535

The fan is switched on using this delay.

With option *minimum time*, the following parameters appear:

Time in s [1...65,535]

Options: 1...20...65,535

The fan remains ON for at least this time.

Function time on OFF

Options: none
 switching delay
 minimum time

The function *Time* at fan ON is defined here with this parameter.

- *none*: No function *Time* is executed.
- *switching delay*: The fan is switched off using this delay.
- *minimum time*: The fan remains OFF for at least this time.

With option *switching delay*, the following parameters appear:

Time in s [1...65,535 x 0.1]

Options: 1...20...65,535

The fan is switched off using this delay.

With option *minimum time*, the following parameters appear:

Time in s [1...65,535]

Options: 1...20...65,535

The fan remains OFF for at least this time.

3.2.6.1 Parameter window - *Status messages*

In this parameter window, the *Status messages* are defined.

The screenshot shows a software interface for configuring status messages. On the left is a vertical menu with the following items: General, Manual operation, Control input, Fan, - Status messages (highlighted in blue), Valve 1, - Function, Valve 2, - Function, Inputs, and Output A. The main area on the right has a light blue background and contains two settings, each with a label and a dropdown menu. The first setting is 'Enable communication object "Status byte mode" 1 bit' with a dropdown menu showing 'no'. The second setting is 'Enable communication object "Status Fan On/Off" 1 bit' with a dropdown menu also showing 'no'.

Enable communication object "Status byte mode" 1 byte

Options: no
yes

From this status byte, the states HEATING, COOLING, automatic, forced operation and the four limitations are indicated directly via a 1 bit coding.

For further information see: [Status byte forced/operation](#), page 146

- yes: The communication object *Status byte mode* is enabled. The following parameter appears:

Send object values

Options: no, update only
after a change
after request
after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Enable communication object "Status Fan On/Off" 1 bit

Options: no
 yes

The communication object *Status fan* can be enabled with this parameter.

Some fans initially require an ON telegram before they are set to a fan speed from the OFF state. This ON telegram acts on a main switch, which has to be switched on. This demand can be implemented with any switch output that is controlled via the *Status fan* communication object. The corresponding switch communication object of the switch actuator should be connected with the *Status fan* communication object.

With the option yes, the following parameters appear:

Send object value

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

The following parameter are only visible if the option *yes* has been selected in the *Enable automatic operation* parameter in the *Fan* parameter window.

Enable communication object "Status automatic" 1 bit

Options: no
 yes

The communication object *Status automatic* is enabled with this parameter.

Telegram value 1 = automatic operation active
 0 = automatic operation inactive

- *yes*: The following parameter appears:

Send object values

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

3.2.6.2 Parameter window - Automatic operation

This parameter window is visible if in parameter window *Fan*, the option *Enable automatic operation* has been selected with the option *yes*.

The screenshot shows a software interface for configuring a fan's automatic operation. On the left is a navigation tree with the following items: General, Manual operation, Control input, Fan, - Status messages, - Automatic operation (highlighted in blue), Valve 1, - Function, Valve 2, - Function, Inputs, and Output A. The main area on the right contains four parameters:

- Object value "automatic On/Off" switch on to the automatic:** A dropdown menu currently showing the value '1'.
- Threshold value OFF <-> ON in % [1...100]:** A numeric input field showing '10' with up and down arrow buttons.
- Hysteresis threshold value in % +/- [0...20]:** A numeric input field showing '5' with up and down arrow buttons.
- Enable limitations:** A dropdown menu currently showing 'no'.

In this parameter window, the threshold values for switchover of the fan speed are defined. Furthermore, the limitations can also be enabled.

The corresponding valve control communication object receives the value 1 if a fan speed is set. If a fan speed is not set, the communication object will receive the value 0.

Object value "automatic On/Off" switch on to the automatic

Options: $\frac{1}{0}$

This parameter defines how to react to a telegram.

- 1: Automatic is activated by a telegram with value 1.
- 0: Automatic is activated by a telegram with value 0.

Threshold value OFF -> ON in % [1...100]

Options: 1...10...100

Here the threshold value, at which switch on occurs, is defined. If the value in the control value communication object is greater than or equal to the parameterized threshold value, it is switched on. If the value is less, then it is switched off.

Hysteresis

threshold value in % +/- [0...20 %]

Options: 0...5...20

Using this parameter a hysteresis, at which switchover to the next fan speed occurs, is set. The hysteresis applies for all three threshold values.

The setting 0 causes immediate switching without hysteresis.

The entered percentage value is directly added to or subtracted from the percentage value of the *Fan speed x threshold value x*. The result is a new upper or lower threshold value.

Example, a three speed fan, hysteresis with fan control

Using hysteresis, a continuous switching between the fan speeds around the threshold value with deviating input signals can be avoided.

Enable limitations

Option: no
yes

- yes: Other parameters appear.

At the same time, 4 communication objects for limitation of the fan speed are enabled:

- *Limitation 1*, e.g. for frost/heat protection
- *Limitation 2*, e.g. for comfort operation
- *Limitation 3*, e.g. for night shutdown
- *Limitation 4*, e.g. for standby operation

Speed ranges (limitations) are defined for the fan with the speed limitation function which may not be exceeded or undershot.

Four limitations are available. These can be used, for example, for the control of various operating modes such as frost/heat protection, night shut-down and standby. In normal cases, the thermostat takes these operating modes into account in its control variable for the actuator.

Important

The parameterized starting behaviour, which is a technical characteristic of the fan, has a higher priority than a limitation or forced operation, i.e. if a limitation is activated in fan speed 2 and a start-up behaviour is parameterized via fan speed 3, the following behaviour will result: The fan is in the OFF state and receives a control signal for fan speed 1. Initially, the fan operates at fan speed 3 (start-up speed) and then proceeds to fan speed 2 that is defined by the limitation. The actual required fan speed 1 will not be achieved due to the limitation.

The sequence of the displayed parameters corresponds with their priorities, i.e. the parameter with the highest priority has limitation 1 followed by limitation 2, 3 and 4.

Note

The fault operation, e.g. as with a malfunction of the thermostat has a lower priority than the fan limitation, i.e. by a limitation of the fan speed during a thermostat malfunction only the upper or the lower limit of the fan limitation can be set at best.

When automatic mode is exited, e.g. by a manual action, the limitations 1...4 remain.

The following points apply for limitations:

- The fan speed and valve position can be parameterized independently.
- The limitation need not necessarily apply to one fan speed only. It can also encompass another range of the fan speeds, i.e. only certain fan speeds can be set if the limitation is active. In this way, a limited control is also possible.
- The limitation is activated if a telegram with the value 1 is received on the limitation communication object. The limitation is deactivated if a telegram with the value 0 is received on the communication object *Limitation x*. A manual action ends automatic mode.
- If a limitation is activated, the Fan Coil Actuator switches to the parameterized fan speed regardless of the control value. If during the activation of the limitation another fan stage or a fan stage outside the range of the "limitation range" is set, the required fan stage or the limit fan stage of the range is set.
- After switch off of the limitations, the fan speed and the communication objects for valve control are recalculated and executed, This means that during limitation the actuator operates normally in the background, the outputs are not changed and implementation only occurs after the end of limitation.

There are the same parameters for each of the individual four limitations used to limit the fan speeds. The priority is according to the listed sequence. The highest priority is assigned to limitation 1, e.g. Frost/Heat protection; the lowest priority is assigned to limitation 4, e.g. standby operation.

ABB i-bus[®] KNX

Commissioning

Fan with limitation 1

Fan with limitation 2

Fan with limitation 3

Fan with limitation 4

Options: inactive
 unchanged
 OFF
 ON

With this parameter, you set which fan speed is set with active limitation, or which speed is not exceeded or undershot.

3.2.7

Parameter window *Valve 1*

In this parameter window, all settings for *Valve 1* are undertaken.

General	Valve control	0-10 V
Manual operation	Valve voltage on bus voltage failure	0 Volt
Control input	Valve voltage when valve inactive	0 Volt ▼
Fan	Valve position after bus voltage recovery	unchanged ▼
- Status messages		
- Automatic operation		
Valve 1		
- Function		
Valve 2		
- Function		
Inputs	Correct valve characteristic curve	no ▼
Output A		

Valve control

0-10 V

Valve position on bus voltage failure

0 Volt

Valve position when valve inactive

Options: 0 Volt
10 Volt

This parameter determines the valve position when the valve is inactive.

Valve position after bus voltage recovery

Options: unchanged
select

- *unchanged*: The valve position does not change after bus voltage recovery.
- *select*: After bus voltage recovery the valve will assume the position as defined in the following parameter.

Valve position in % [0...100]

Option: 0...100

This parameter defines the position of the valve after bus voltage recovery as a percentage.

Correct valve characteristic curve

Option: no
yes

- yes: The [Parameter window - Curve](#), page 72, appears This is adapted in the characteristic of the valve

3.2.7.1

Parameter window - *Function*

Various communication objects can be enabled in the parameter window - *Function*.

Parameter	Value
Enable communication object "Disable" 1 bit	no
Enable communication object "Forced operation" 1 bit	no
Enable communication object "Valve position status" 1 byte/1 bit	no
Enable valve purge	no

Enable communication object "Disable" 1 bit

Options: no
yes

- yes: The 1 bit block communication object *Block* is enabled. it can be used to block the valve. The current valve position is retained. The following parameter appears:

Disable on object value

Options: $\frac{1}{0}$

This parameter defines the communication object value, which disables/blocks the valve. Incoming setting values are stored. After the valve is re-enabled, the last setting value received is set.

Enable communication object "Forced operation" 1 bit

Options: no
 yes

- yes: The 1 bit communication object *Forced operation* is enabled. The valve can be forcibly operated in this way. The following parameters appear:

Forced operation on object value

Options: $\frac{1}{0}$

This parameter defines the communication object value which forcibly operates the valve.

Valve position on forced operation in % [0...100]

Options: 0...30...100

This parameter determines the valve position in % during forced operation. Incoming setting values are stored. After forced operation is removed, the last setting value received is set.

Note
Forced operation is only undertaken with an active valve and remains ineffective with a deactivated valve.

Enable communication object "Valve position status" 1 byte / 1 bit

Options: no
 1 bit
 1 byte

Note
The valve position status is sent immediately after the control value is received.

- 1 bit: The following parameters appear:

Send object value

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Object value with valve position > 0

Options: $\frac{1}{0}$

- 1 byte: The following parameter appears:

Send object value

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Enable valve purge

Options: no
 yes

- yes: The 1 bit communication object *Trigger valve purge* is enabled. The following parameters appear:

Note

If the valve purge is interrupted by a higher priority, it will restart after the completion of the priority task, unless, for example, the control value was 100 % or it was active for the duration of the purge time due to the higher priority. The valve position for purging is always the control value 100 %.

For further information see: [Behaviour with, ..., S. 138](#)

Enable communication object "Status valve purge" 1 bit

Options: no
 yes

- yes: The 1 bit communication object *Status valve purge* is enabled.

The status of the valve purge is visible via this communication object. The following parameter appears:

Send object value

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Note

The status is sent immediately as soon as a new control value is received.

Duration of valve purge in min. [1...255]

Options: 1...10...255

This parameter defines the time duration for the valve purge. In this time, the valve is fully opened. When the time has elapsed, the state before the purge is re-established.

Note

The opening time of the valve must be considered when entering the purge time.

Automatic valve purge

Options: no
yes

- yes: The following parameters appear:

Purge cycle in weeks [1...12]

Options: 1...6...12

The counter for automatic purging starts to run when the parameter is downloaded. The time is re-set each time it is downloaded.

The time is reset as soon as purging is completed. This can occur either through automatic purging or via the communication object *Trigger valve purge*.

Note

Purging can also be triggered via the bus with the communication object *Trigger valve purge*.
After bus voltage recovery and download, the purge cycle continues, the bus failure time – the time for which the bus actually failed – is not considered.
The purging cycle will restart if *Purge cycle in weeks [1...12]* is changed after the download.

Reset purge cycle from control value in % [1...99]

Options: 1...99

Hereby, the purge cycle from the set control value is reset.

3.2.7.2

Parameter window - Curve

The parameter - Curve is visible if in [Parameter window Valve 1](#) the parameter *Correct valve characteristic curve* the option yes has been selected.

Parameter	Value
Value pair 1 Control value in % [0...100]	0
Value pair 1 Valve position in % [0...100]	0
Value pair 2 Control value in % [0...100]	100
Value pair 2 Valve position in % [0...100]	100
Further value pair	no

The following must be considered with the curve entries:

- The value pairs can be entered in any sequence. They are sorted in ascending order of the control value in the device, and intermediate values are interpolated.
- If value pairs have the same control value, the value pair with the largest value position applies. All other value pairs are ignored.
- The value pair with the smallest valve position applies for the correction of the smaller control values.
- If no value pair has been entered for the control value 0 %, the valve position of the first value pair applies for all control values from 0 to the first value pair.
- If no value pair has been entered for the control value 100 %, the valve position from the last value pair up to 100 % applies for the last value pair.

Note

The characteristic curve adjustment is active with forced operation.

Caution

A parameterization of the value pair with the same control value leads to an undefined state and should be strictly avoided. Otherwise it can lead to destruction of the HVAC system.

Value pair 1

Control value in % [0...100]

Options: 0...100

Valve position in % [0...100]

Options: 0...100

Value pair 2

Control value in % [0...100]

Options: 0...100

Valve position in % [0...100]

Options: 0...100

Value pair 1 forms the lower limit and value pair 2 forms the upper limit of the curve.

The possibility of activating other value pairs allows different curve characteristics to be realised.

For further information see: [Valve curve](#), page 131

A total of four value pairs can be set.

Further value pair

Options: no
yes

- yes: A further value pair can be set.

Value pair 3

Control value in % [0...100]

Options: 0...50...100

Valve position in % [0...100]

Options: 0...50...100

Further value pair

Options: no
yes

- yes: A further value pair can be set.

Value pair 4

Control value in % [0...100]

Options: 0...50...100

Valve position in % [0...100]

Options: 0...50...100

3.2.8 Parameter window *Valve 2*

The setting options of *Valve 2* do not differentiate from those of *Valve 1*.

The descriptions of the parameter setting options and adjustable communication objects for *Valve 2* are described under [Parameter window Valve 1](#), page 67.

3.2.9 Parameter window Inputs

In this parameter window, Inputs a...c are defined.

Parameter	Value
Enable input a (binary input, contact scanning)	no
Enable input b (binary input, contact scanning)	no
Enable input c (binary input, contact scanning)	no

Enable input a
(binary input, contact scanning)

Enable input b
(binary input, contact scanning)

Enable input c
(binary input, contact scanning)

Options: no
yes

- yes: The input is activated. The corresponding parameter window is enabled.

3.2.9.1 Parameter window *Input a*

In this parameter window, all settings for the *Input a* are undertaken.

This parameter window is visible if in [Parameter window Inputs](#), page 24, in parameter *Input a (binary input, contact scanning)*, the option *yes* has been selected.

General	Distinction between long and short operation	no
Manual operation	Reaction on closing the contact (rising edge)	on
Control input	Reaction on opening the contact (falling edge)	off
Fan	Scan input after download, ETS-reset and bus voltage recovery	no
- Status messages	Debounce time	100 ms
- Automatic operation	Cyclic sending of object "Switch"	no
Valve 1	Activate minimum signal time with rising edge	no
- Function	Activate minimum signal time with falling edge	no
Valve 2		
- Function		
Inputs		
Input a		
Output A		

Distinction between short and long operation

Options: no
yes

Using this parameter, you decide if the input differentiates between short and long operation.

- **yes:** After opening/closing of the contact, it must first of all be ascertained if a short or long operation has occurred here. Only thereafter will a possible reaction be triggered.

The following drawing shows the function in detail:

T_L is the time duration from where a long operation is detected.

3.2.9.1.1

Parameter *Distinction between short and long operation* – *no*

If the option *no* is selected with the parameter *Distinction between long and short operation*, the following parameters in the parameter window *Input a* are visible.

General	Distinction between long and short operation	no
Manual operation		
Control input		
Fan	Reaction on closing the contact (rising edge)	on
- Status messages		
- Automatic operation	Reaction on opening the contact (falling edge)	off
Valve 1		
- Function	Scan input after download, ETS-reset and bus voltage recovery	no
Valve 2		
- Function	Debounce time	100 ms
Inputs		
Input a	Cyclic sending of object "Switch"	no
Output A		
	Activate minimum signal time with rising edge	no
	Activate minimum signal time with falling edge	no

Reaction on closing the contact (rising edge)

Options: on
off
TOGGLE
no reaction
terminate cyclic sending

Reaction on opening the contact (falling edge)

Options: on
off
TOGGLE
no reaction
terminate cyclic sending

For each edge, a definition is made to determine if the object value *ON*, *OFF* or *TOGGLE* is switched or if there should be *no reaction*.

Scan input after download, ETS-reset and bus voltage recovery

Options: no
yes

- *no*: The communication object value is not scanned after a download, ETS reset and bus voltage recovery.
- *yes*: The communication object value is scanned after a download, ETS reset and bus voltage recovery. The following parameter appears:

Inactive wait state after bus voltage recovery in s [0...30,000]

Options: 0...30,000

Here the waiting time after a bus voltage recovery is set. After the waiting time has elapsed, the state on the input terminals is scanned. The input reacts as if the state on the input terminals has just been set/not set.

Note

The inactive waiting time does not add to the actual, adjustable send delay time. This can be set separately.

Debounce time

100 ms

Debouncing prevents unwanted multiple operations of the input, e.g. due to bouncing of the contact.

What is the debounce time?

If an edge is detected at an input, the input will react immediately to this edge (e.g. by sending a telegram). At the same time, the duration of the debounce time T_D starts. The signal on the input is not evaluated within the debounce time duration.

Example: Debounce time of the input signal for a detected edge:

After detection of an edge on the input, further edges are ignored for the debounce time T_D .

Cyclic sending of object "Switch"

Options: no
yes

- yes: The following parameters appear:

with object value

Options: 1
 0
 0 or 1

- 1: The communication object value is sent cyclically with 1.
- 0: The communication object value is sent cyclically with 0.
- 0 or 1: The communication object is sent cyclically.

What is cyclic sending?

Cyclic sending enables the communication object *Switch* to send automatically at a fixed interval.

If cyclic sending is only carried out for a specific communication object value (ON or OFF), this condition refers to the value of the communication object. It is therefore possible in principle to start cyclic sending by sending a value to the communication object *Switch*. As this behaviour is generally unwanted, the flags *Write* and *Update* of the communication object are deleted in the preliminary setting so that they cannot be changed via the bus. If this functionality is still required however, these flags should be set accordingly.

With changes to the communication object *Switch* and after bus recovery changes (after the send delay time has elapsed), the communication object value is sent immediately on the bus and the transmission cycle time restarts.

Telegram repeated in s [1...65,535]

Options: 1...60...65,535

The send cycle time describes the time used between two cyclically sent telegrams.

Activate minimum signal time with rising edge

Options: no
 yes

- yes: The following parameter appears:

in value x 0.1 s [1...65,535]

Options: 1...65,535

Activate minimum signal time with falling edge

Options: no
yes

- yes: The following parameter appears:

in value x 0.1 s [1...65,535]

Options: 1...65,535

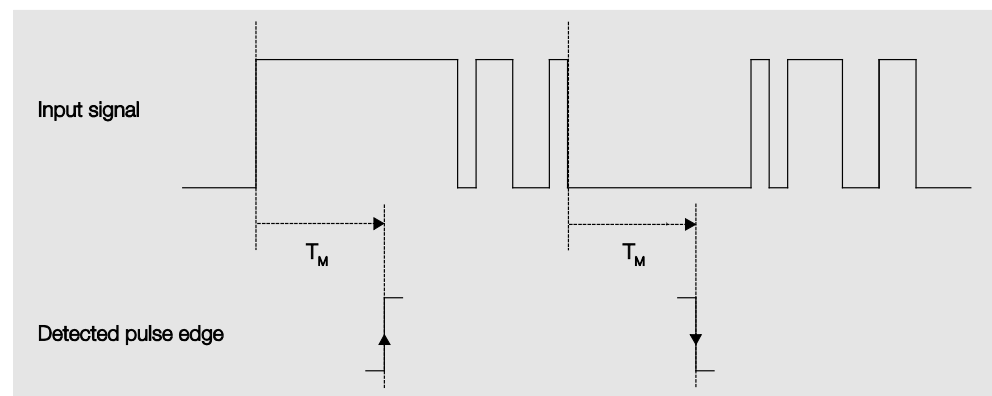

What is the minimum signal time?

In contrast to the debounce time, a telegram is only sent after the minimum signal duration has elapsed.

The individual functions:

If an edge is detected on the input, the minimum signal duration will commence. No telegram is sent on the bus at this time. The signal on the input is observed within the minimum signal duration. If a further edge appears at the input during the minimum signal duration, it will be interpreted as a new operation, and the minimum signal duration restarts. If the input signal duration has not changed during the minimum signal duration, an edge is detected and a telegram is sent on the bus.

Example: Minimum signal duration of the input signal for a detected edge:

As only two edges remain stable for the minimum signal time T_M, only these are detected as valid.

3.2.9.1.2

Parameter *Distinction between short and long operation* – yes

If with parameter *Distinction between long and short operation*, the option yes has been selected, the following parameters in parameter window *Input a* are visible.

General	Distinction between long and short operation	yes
Manual operation	Reaction on short operation	yes
Control input	Reaction on long operation	off
Fan	Long operation after ...	0.8 s
- Status messages	Input is by operation	closed
- Automatic operation	Enable communication object with "Long operation" 1 bit	no
Valve 1	Debounce time	100 ms
- Function		
Valve 2		
- Function		
Inputs		
Input a		
Output A		

Reaction on short operation

Options: on
off
TOGGLE
no reaction

Reaction on long operation

Options: on
off
TOGGLE
no reaction

For each edge, a definition is made to determine if the object value *ON*, *OFF* or *TOGGLE* is switched or if there should be *no reaction*.

Long operation after...

Options: 0.3/0.4/0.5/0.6/0.8 s
1/1.2/1.5 s
2/3/4/5/6/7/8/9/10 s

Here the time period T_L after which an actuation is considered a "long" operation, is defined.

Input is by operation

Options: closed
opened

- *closed*: The input is closed with actuation.
- *opened*: The input is opened with actuation.

Enable communication object with "Long operation" 1 bit

Options: no
yes

Debounce time

100 ms

Debouncing prevents unwanted multiple operations of the input, e.g. due to bouncing of the contact.

What is the debounce time?

If an edge is detected at an input, the input will react immediately to this edge (e.g. by sending a telegram). At the same time, the duration of the debounce time T_D starts. The signal on the input is not evaluated within the debounce time duration.

Example: Debounce time of the input signal for a detected edge:

After detection of an edge on the input, further edges are ignored for the debounce time T_D .

3.2.9.2 Parameter window *Input a...c*

The *Inputs b...c* do not differ from *Input a*.

The descriptions of the parameter setting options and adjustable communication objects for the *Inputs b...c* described under [Parameter window Input a](#), page 75.

3.2.10 **Parameter window *Output A***

All settings for the *Output A* are made in this parameter window.

General	Enable output A (switch contact 20 AX)	yes
Manual operation		
Control input		
Fan	Reaction of output	normally opened contact
- Status messages		
- Automatic operation	Contact position on bus voltage failure	unchanged
Valve 1	Object value "Switch" on bus voltage recovery	not write
- Function		
Valve 2	Enable time function	no
- Function		
Inputs	Enable communication object "Status switch" 1 bit	no
Output A		

**Enable output A
(switch contact 20 AX)**

Options: no
 yes

- yes: Output A is enabled. The following parameters appear:

Reaction of output

Options: normally opened contact
 Normally closed contact

This parameter whether the output operates as a *Normally closed contact* or *Normally open contact*.

- *Normally opened contact*: An ON telegram (1) closes the contact and an OFF telegram (0) opens the contact.
- *Normally closed contact*: An ON telegram (1) opens the contact and an OFF telegram (0) closes the contact.

Contact position on bus voltage failure

Options: opened
 closed
 unchanged

This parameter defines the state that the parameter should assume at bus voltage failure.

- *opened*: The contact is opened with bus voltage failure.
- *closed*: The contact is closed with bus voltage failure.
- *unchanged*: No change of the contact position.

Note
The reaction on bus voltage failure and download is to be monitored.

Object value "Switch" on bus voltage recovery

Options: not write
 write with 0
 write with 1

With this parameter, the output can be influenced by the value of the communication object *Switch* on bus voltage recovery.

The communication object *Switch* can be written with either a 0 or 1 when the bus voltage recovers. The contact position is redefined and set in dependence on the set device parameterization.

- *not write*: The communication object assumes the value 0. This value remains as it is until modified via the bus. The contact position is only re-evaluated at this time.

Note

The reaction on bus voltage failure, recovery and download is to be monitored.

The Fan Coil Actuator draws the energy for switching the contact from the bus. After bus voltage is applied, sufficient energy is only available after about ten seconds in order to switch all contacts simultaneously.

Depending on the set transmission and switching delay after recovery of bus voltage set in the parameter window *General*, the individual outputs will only assume the desired contact position after this time.

If a shorter time is set, the device will only switch the first contact when sufficient energy is stored in the device, in order to ensure that enough energy is available to immediately bring all outputs safely to the required position with a renewed bus voltage failure

Enable time function

Options: no
 yes

- *no*: The parameter window remains disabled and invisible.
- *yes*: The communication object *Block staircase lighting* as well as the parameter window - *Time* are enabled.

Enable communication object
"Status switch" 1 bit

Options: no
 yes

- yes: The following parameters appear:

Send object value
(Object "Status switch")

Options: no, update only
 after a change
 after request
 after a change or request

- *no, update only*: The status is updated but not sent.
- *after a change*: The status is sent after a change.
- *after request*: The status is sent after a request.
- *after a change or request*: The status is sent after a change or a request.

Object value of contact position
(Object "Status switch")

Options: 1=closed, 0=open
 0=closed, 1=open

With this parameter, the communication object value of the switch status (*Status switch*) is defined.

- *1=closed, 0=open* A closed contact is represented by communication object value 1 and an open contact is represented by the value 0.
- *0=closed, 1=open* A closed contact is represented by communication object value 0 and an open contact is represented by the value 1.

Note
The contact position and thus the switch status can result from a series of priorities and links.

3.2.10.1 Parameter window - *Time function*

In this parameter window, all settings for the function *Time* are undertaken:

This parameter window is visible if in [Parameter window Output](#), page 84, with parameter *Enable function Time*, the option yes has been selected.

General	Object value "Disable time function" on bus voltage recovery	unchanged
Manual operation	Staircase lighting time in s [1...65,535]	30
Control input	Staircase lighting can be switched	ON with 1 and OFF with 0
Fan	Enable communication object "Change stairc. light. duration"	no
- Status messages	Enable communication object "Permanent ON" 1 bit	no
- Automatic operation		
Valve 1		
- Function		
Valve 2		
- Function		
Inputs		
Output A		
- Time function		

Object value "Disable time function" on bus voltage recovery

Options: unchanged
1, i.e. Disable time function
0, i.e. Enable time function

- *unchanged*: The function *Time* can continue unchanged.
- *1, i.e. Disable time function*: The function *Time* is disabled.

Note

They can only be enabled via the communication object *Disable time function*.

- *Enable time function*: The function *Time* is enabled and active after a bus failure.

Note

If the staircase light is disabled when the function *Time* is operational, the light will stay ON until it is switched OFF manually.

Staircase lighting time in s [1...65,535]

Options: 1...30...65,535

The staircase lighting defines how long the contact is closed – provided that the contact is programmed as a normally open contact – and how long the light remains on after an ON telegram. The input is made in seconds.

Staircase lighting can be switched

Options: ON with 1 and OFF with 0
ON with 1 no action with 0
ON with 0 or 1, switch OFF not possible

This parameter defines the telegram value used for switching the staircase lighting on and off prematurely.

- *ON with 0 or 1, switch OFF not possible:* The function *Staircase lighting* is switched on independently of the value of the incoming telegram. Premature switch off is not possible.

Enable communication object "Change stairc. light. duration"

Options: no
yes

- *yes:* A 2 byte communication object *Change duration of staircase lighting* is enabled. The staircase lighting time can be changed via the bus with this communication object. The value defines the staircase lighting time in seconds. The staircase lightning time which has already commenced is completed. A change of the staircase lighting time is used the next time it is accessed.
- *no:* No modification of the staircase lighting time is possible via the bus.

Note

With bus voltage failure the changed staircase lighting time is saved. Only after a renewed down-load of the application program is the staircase lighting time overwritten.

How does the staircase light behave with bus voltage recovery?

The reaction at bus voltage recovery is defined by two conditions:

- With the communication object *Block staircase light*: If the function *Time* is blocked after bus voltage recovery, the staircase lighting can only be switched on or off via the communication object *Switch*.
- Using the parameterization of the communication object *Switch*: Whether the light is switched on or off with bus voltage recovery depends on the programming of the communication object *Switch*.

Enable communication object "Permanent ON" 1 bit

Options: no
 yes

If the communication object *Permanent ON* is assigned with the value 1, the output is switched on irrespective of the value of the communication object *Switch* and remains switched on until the communication object *Permanent ON* has the value 0. After ending the Permanent ON state, the staircase will react as defined in the following parameters.

Example
This communication object can be used, for example, to allow the caretaker or maintenance and cleaning personnel to initiate a permanent ON.

- yes: The communication object *Permanent ON* is enabled. The following parameter appears:

Restart of staircase time after end of permanent ON

Options: no
 yes

- yes: The lighting remains on and the staircase lighting time restarts.
- no: The lighting switches off if *Permanent ON* is ended.

3.3 Communication objects

3.3.1 Short overview of the communication objects

CO no.	Function	Name	Data Point Type (DPT)	Length	Flags

3.3.4.6

Communication object *Fault control value*

No.	Function	Communication object name	Data type	Flags
33	Fault control value	Control input	1 bit DPT 1.005	C, R, T
<p>The communication object is enabled if in parameter window <i>Control input</i>, the parameter <i>Monitoring control values e.g. thermostat</i> has been selected with the option <i>yes</i>.</p> <p>This communication object indicates a malfunction of the control value, e.g. of a thermostat.</p> <p>The Fan Coil control reports a fault and assumes the safety position with the communication object <i>Fault control value</i>. This safety position affects the fan speed and the valves.</p> <p>Telegram value: 0 = no fault 1 = fault</p> <div style="border: 1px solid black; padding: 5px; margin-top: 10px;"> <p>Note</p> <p>If the communication object value <i>Control value HEATING</i>, <i>Control value COOLING</i> or <i>Control value, HEATING/COOLING</i> remains off for a parameterized time, a fault of the thermostat is assumed. If communication object 32 <i>Toggle HEATING/COOLING – Control input</i> receives a value, the monitoring time is re-started.</p> </div>				

3.3.5 Communication objects *Multi-level fan*

No.	Function	Communication object name	Data type	Flags																								
10	Fan speed switch	Fan	1 byte DPT 5.010	C, W																								
<p>The communication object is enabled if in parameter window <i>Fan</i> the parameter <i>Enable direct operation</i> and <i>Enable communication object "Fan speed switch" 1 byte</i> are selected with option <i>yes</i>.</p> <p>With this communication object, the fan can be switched on via a 1 byte communication object of a fan speed. If another fan speed is switched on at this point it will be switched off. A new fan speed is switched on taking the transition times, dwell times and start-up phase into consideration.</p> <p>Limitations through forced operation or one of the four limitations 1...4 are retained. Automatic operation is disabled. A renewed activation of automatic mode occurs via the communication object <i>Automatic ON/OFF</i>.</p> <p>The following telegram values result:</p> <table><tr><th>1 byte value</th><th>Hexadecimal</th><th>Binary value bit 76543210</th><th>Fan speed</th></tr><tr><td>0</td><td>00</td><td>00000000</td><td>0 (OFF)</td></tr><tr><td>1</td><td>01</td><td>00000001</td><td>Fan speed 1</td></tr><tr><td>2</td><td>02</td><td>00000010</td><td>Fan speed 2</td></tr><tr><td>3</td><td>03</td><td>00000011</td><td>Fan speed 3</td></tr><tr><td>>3</td><td>>03</td><td>>00000011</td><td>Values greater than 3 are ignored</td></tr></table>					1 byte value	Hexadecimal	Binary value bit 76543210	Fan speed	0	00	00000000	0 (OFF)	1	01	00000001	Fan speed 1	2	02	00000010	Fan speed 2	3	03	00000011	Fan speed 3	>3	>03	>00000011	Values greater than 3 are ignored
1 byte value	Hexadecimal	Binary value bit 76543210	Fan speed																									
0	00	00000000	0 (OFF)																									
1	01	00000001	Fan speed 1																									
2	02	00000010	Fan speed 2																									
3	03	00000011	Fan speed 3																									
>3	>03	>00000011	Values greater than 3 are ignored																									
11	Switch speed 1	Fan	1 bit: DPT 1.001	C, W																								
<p>The communication object is enabled if in parameter window <i>Fan</i>, the parameter <i>Enable direct operation</i> and <i>Enable communication object "Switch speed x" 1 bit</i> are selected with option <i>yes</i>.</p> <p>Via the 1 bit communication object, the Fan Coil Actuator can receive a control value for fan speed 1.</p> <p>Limitations through forced operation or one of the four limitations 1...4 are retained. Automatic operation is disabled. A renewed activation occurs via the communication objects <i>Automatic ON/OFF</i>.</p> <p>If several 1 ON telegrams are received by the various speed communication objects <i>Speed x</i>, the value last received for the fan control is decisive. This also applies for the OFF telegram 0. If the actuator for a switched OFF speed again receives an OFF, command it is carried out, this means that another speed switched on at this time will be switched off even though the respective fan speed communication object does not act directly on the fan speed. The last telegram – in this case the OFF telegram of another fan speed – is always executed.</p> <p>Telegram value: 0 = fan OFF 1 = fan ON in speed 1</p>

ABB i-bus® KNX Commissioning

No.	Function	Communication object name	Data type	Flags
48	Staircase lighting duration	Output	2 byte DPT 7.005	C, R, W
<p>This communication object is enabled if in parameter window - <i>Time</i>, the parameter <i>Enable communication object "Change duration of staircase lighting" 2 byte</i> has been selected with option <i>yes</i>.</p> <p>The duration of staircase lighting is set here. The time is defined in seconds. After bus voltage recovery, the value of the communication object is set by the programmed value and the value set via the bus is overwritten.</p> <p>The staircase lighting time can be changed via the bus with this communication object. The time is defined in seconds.</p> <p>The staircase lighting time which has already commenced is completed. A change of the staircase lighting time is used the next time it is accessed.</p> <p>With bus voltage failure the changed staircase lighting time is retained. Only after a complete download of the application program, a version change, when the device has been discharged or with an ETS reset, is the staircase lighting time duration overwritten with the value set in the parameters.</p>				
49	Status Switch	Output	1 bit DPT 1.001	C, R, T
<p>In the parameter window <i>Output</i> you can parameterize whether the communication object value <i>no</i>, <i>update only</i>, <i>after a change</i> or <i>after request</i> is sent on the bus.</p> <p>The communication object value directly indicates the current contact position of the switching relay.</p> <p>The status value can be inverted.</p> <p>Telegram value 1 = relay ON or OFF depending on the parameterization 0 = relay OFF or ON depending on the parameterization</p>				

4 Planning and Application

In this section you will find a description of different types of fans, blowers and fan coil controls. Here also are some tips and application examples are described for practical use of the device.

4.1 Heating, ventilation, climate control with Fan Coil units

The Fan Coil Actuator FCA/S controls single-phase fans, blowers or fan coil units. Three speed single phase fans with step or changeover control are possible.

Special fan properties such as switchover pauses, dwell times and a start-up phase can be parameterized. Up to two input variables for heating and cooling signals, e.g. for a thermostat, are available. As output variables, the Fan Coil Actuators generate up to two valve communication objects, which they can use to control the valves in a heating or cooling circuit. .

The separate fan and valve parameterization in the FCA/S provides a maximum in flexibility and very many combination possibilities for various applications in the heating, ventilation and air-conditioning (HVAC) field.

4.1.1 Terms

Fan Coil unit is a term used for a fan convector or blower convection unit.

The Fan Coil unit is connected to a central heating and cooling water supply and generates the desired temperature for the room. A room can be heated, cooled and ventilated using a Fan Coil unit.

4.1.2 Fan operation

In fan operation a single phase fan, blower or convector can be controlled. In combination with a valve control 2, 3 or 4 pipe system can be implemented. The fans are controlled via a 3 speed controller. For this purpose, 3 windings are tapped off of the fan motor. The speed which results is dependent on the tap-off. It must be ensured that two contacts are not switched on simultaneously. For control purposes at least one 3 speed changeover switch with zero position is usually used. This switch is simulated with a group of outputs in the Fan Coil Actuator.

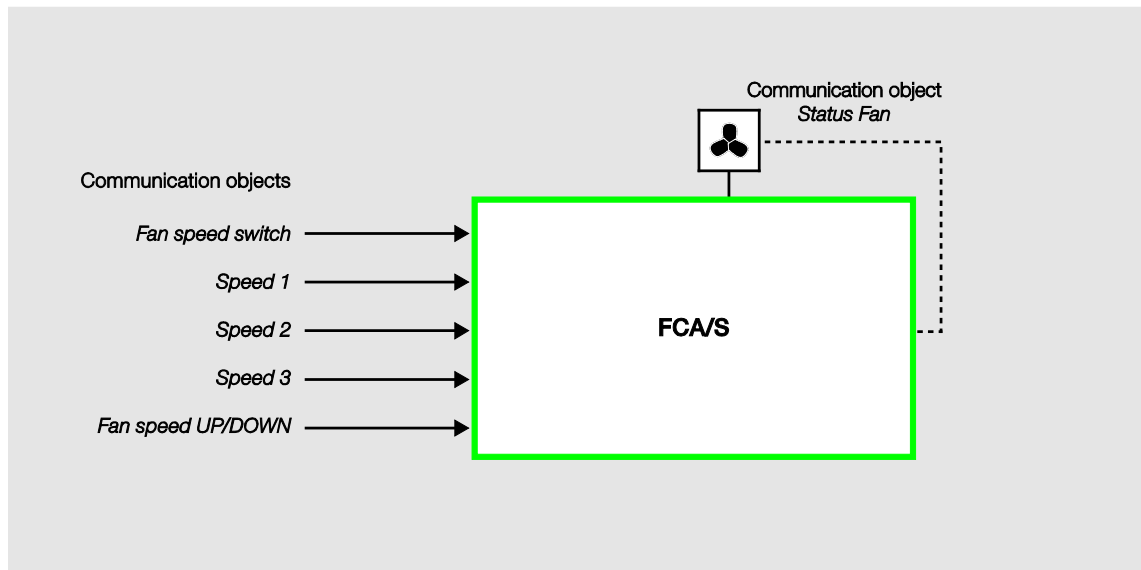

ABB i-bus® KNX

Planning and Application

The control of the FCA/S is implemented in accordance with the following schematic principle:

With three *Fan stage x switch* (x = 1, 2, or 3) communication objects that are independent of each other, the fan stages are controlled via the outputs of the Fan Coil Actuator.

Alternatively, the fan control can be implemented via a 1 byte communication object *Switch speed* or via the communication object *Fan speed up/down*.

Some ventilation controls require an additional central switch on mechanism (main switch) in addition to the speed switch. This can be implemented with a further output of the Fan Coil Actuator. The output must be linked to the communication object *Status Fan ON/OFF*. Hereby, the main switch is switched on if at least one fan speed is set. If the fan is OFF (*Status Fan ON/OFF* = 0), the main switch is also switched off.

ABB i-bus[®] KNX Planning and Application

4.1.2.1 Fan in a two-way connection

Control of a fan is usually implemented with a changeover switch.

The following control table results for a three-stage fan, which simulates the FCA/S with a group of switch outputs:

	Terminal 8	Terminal 9	Terminal 10
OFF	0	0	0
Fan speed 1	1	0	0
Fan speed 2	0	1	0
Fan speed 3	0	0	1

4.1.2.2 Fan with speed switching

In some cases, the fan is controlled via a step switch. The following control table results for a three-speed fan, which simulates the FCA/S with its outputs:

	Terminal 8	Terminal 9	Terminal 10
OFF	0	0	0
Fan speed 1	1	0	0
Fan speed 2	1	1	0
Fan speed 3	1	1	1

The step switch cannot be switched on rapidly. If for example, fan speed 3 is to be switched on from the OFF state, fan speeds 1 and 2 must be controlled with the associated dwell times first.

4.1.3 Configuration of a HVAC system with Fan Coil units

A HVAC system with Fan Coil units (HVAC = heating, ventilation, air-conditioning) consists of a central heating and cooling water system. The Fan Coil units are installed in rooms and directly connected to the heating and cooling circuit.

4.1.4 Design of a Fan Coil unit

The Fan Coil unit consists of a fan or blower-convactor and one or two heat exchangers, which emit heating or cooling power to the room.

If only one heat exchanger and one heating or cooling circuit is available, you have a 2 pipe system.

If two heat exchangers with two separate heating and cooling circuits are in use, you have a 4 pipe system. The Fan Coil Actuator directly controls the fan.

The heat exchanger and the fan are the most important components of a Fan Coil unit. Heating or cooling water flows in the heat exchanger depending on the desired room temperature. The flow of water through the heat exchanger is controlled via the valves.

The fan blows air past the heat exchanger and into the room through a filter. The air is heated or cooled in the heat exchangers and thus generates the desired room temperature. The fan is driven by a motor. The motor and the valves are controlled by a Fan Coil Actuator.

The water condensation which results during cooling collects in a condensation water trough.

ABB i-bus® KNX

Planning and Application

4.1.5 Pipe systems

A Fan Coil unit can be configured as a 2-, 3- or 4-pipe system.

ABB i-bus® KNX

Planning and Application

4.1.5.1 2 pipe system, configuration

The 2 pipe system consists of just a single water circuit, which is heated or cooled alternately to suit the season. In a 2 pipe Fan Coil unit there is only one heat exchanger with a valve.

Note

In some HVAC systems, cooling is undertaken exclusively using a 2 pipe Fan Coil unit. The heating function is undertaken by a conventional heater or an electrical heater.

ABB i-bus® KNX

Planning and Application

4.1.5.2 2 pipe system HEATING and COOLING

In this system only one heat exchanger is available for HEATING and COOLING. Depending on the weather, warm or cold water is supplied centrally to the pipe system (2 pipes). The Fan Coil Actuator or the thermostat is informed if warm or cold water is currently flowing through the system. Depending on this setting, both control values act on just a single valve. The thermostat decides which control value (HEATING/COOLING) is actively sent. The FCA/S controls the fan speed and only one valve.

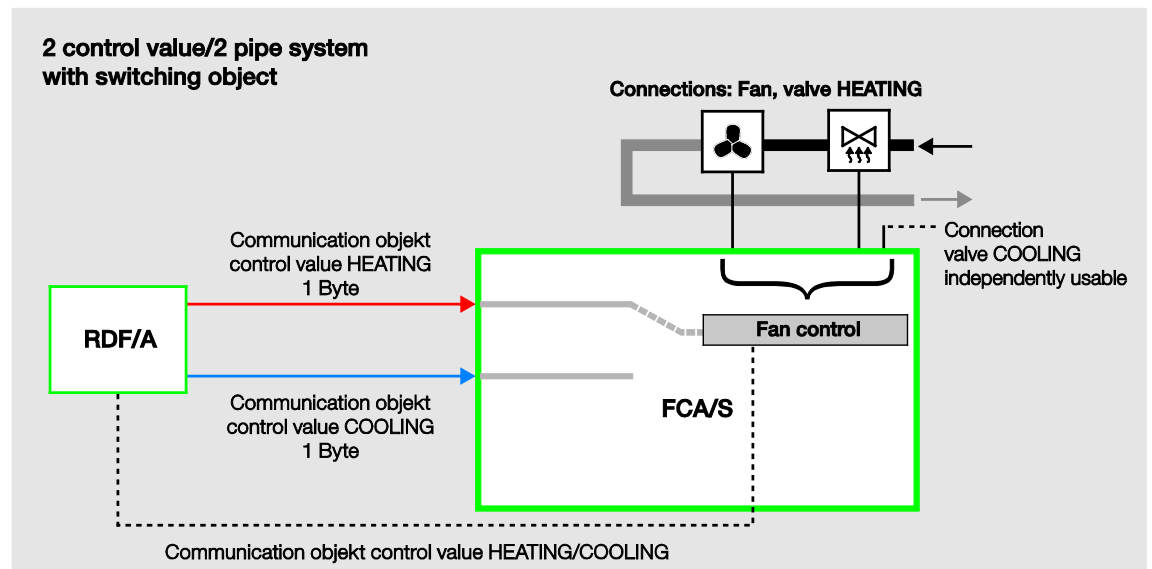

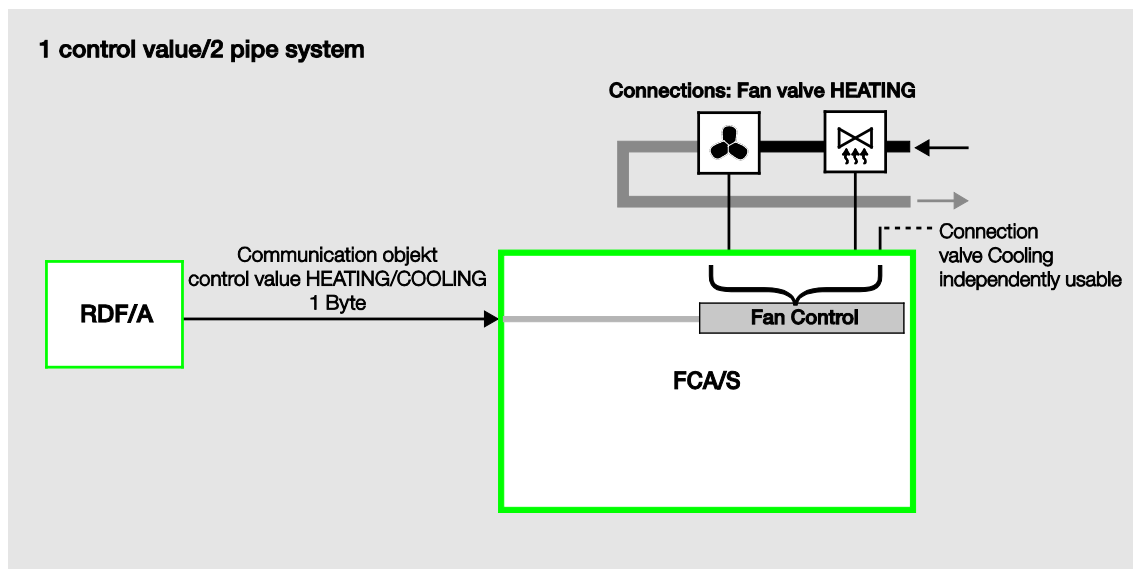

ABB i-bus® KNX

Planning and Application

4.1.5.3 2 pipe system HEATING or COOLING

In this system, one heat exchanger is available for HEATING or COOLING. The control value for HEATING or COOLING is provided by a thermostat. Only warm or only cold water is supplied centrally to the pipe system (2 pipes). Depending on this setting one control value acts on one valve. The thermostat sends the control value (COOLING) and the FCA/S controls the fan speed and the valve.

Note

Both 2-pipe systems can be established using a 3 stage fan or blower.

Depending on the control value (1 byte or 1 bit) which is sent from a thermostat, the Fan Coil Actuator determines the corresponding fan stages (speeds) via programmable threshold values.

ABB i-bus® KNX Planning and Application

For a continuous control value (1 byte; 0...100 %), the threshold values for the fan speeds can be defined for example as follows:

Example

Three speed fan:

Switch thresholds in the FCA/S:

Fan speed 1: 1...29 %	Off -> Fan speed 1 = 1%
Fan speed 2: 30...59%	Fan speed 1 -> 2 = 30%
Fan speed 3: 60...100%	Fan speed 2 -> 3 = 60%

4.1.5.4

3 pipe system, configuration

The 3 pipe system has a similar design to the 4 pipe system. There is a separate inlet for heating and cooling water as well as two separate heat exchangers with one valve each. In contrast to a 4 pipe system, the 3 pipe system has a common return for heating and cooling water.

The Fan Coil Actuator directly controls the fan and provides two communication objects for control of the valves.

ABB i-bus® KNX Planning and Application

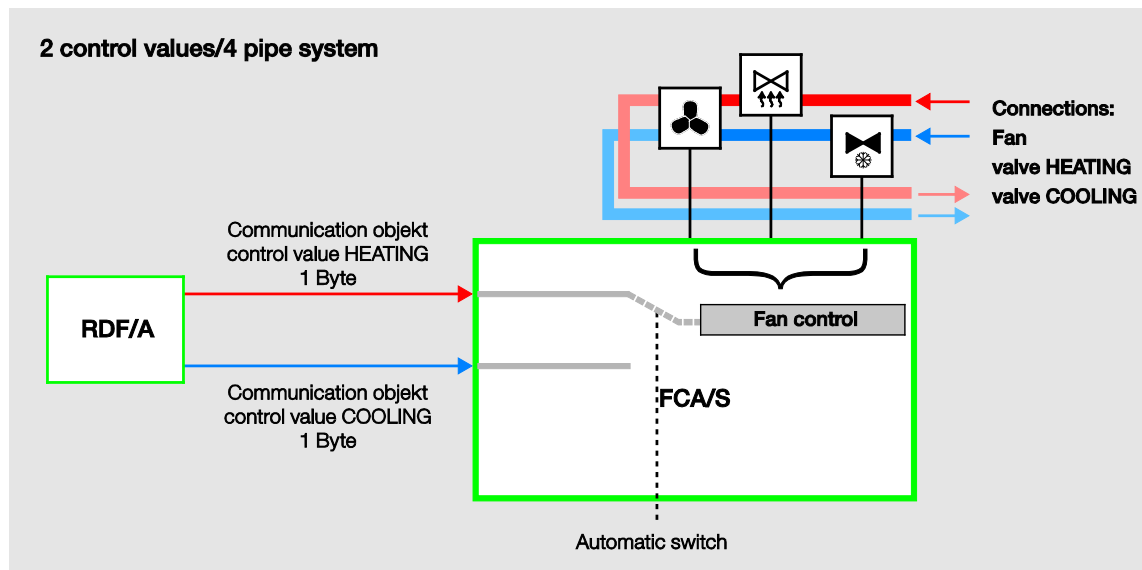

4.1.5.5

4 pipe system, configuration

In a 4 pipe system two separate heat exchangers (for HEATING and COOLING) are available. Warm and cold water is provided centrally to two separate pipe systems (of 2 pipes each).

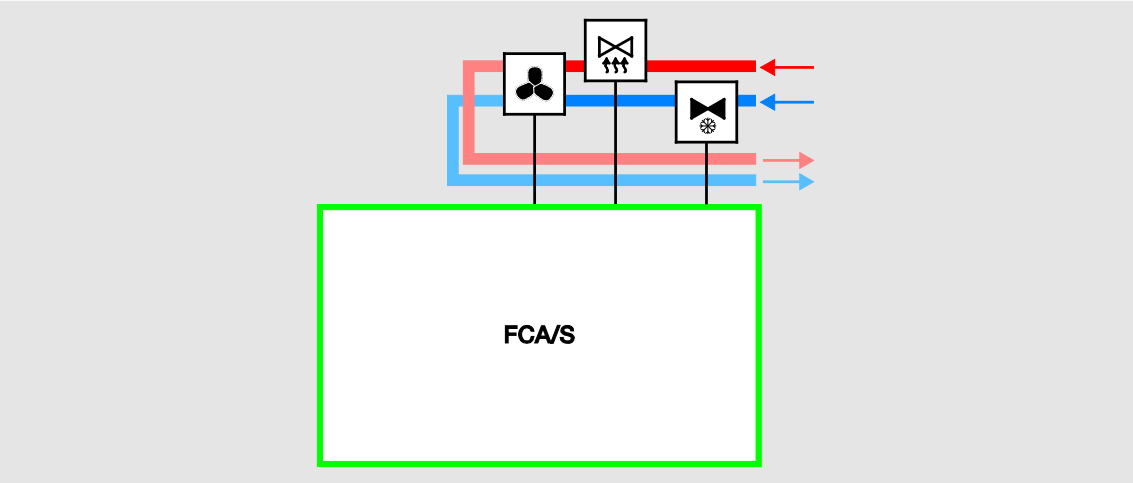

The thermostat on-site decides if heating or cooling is applied. The thermostat sends a separate heating and cooling signal.

The Fan Coil Actuator directly controls the fan.

4.2 System configuration with a Fan Coil Actuator

In this function, the Fan Coil Actuator is used for control of the heating and cooling valve as well as for switching the fan outputs. Temperature detection is undertaken by a thermostat.

Even the offset of the set point value as well as changeover of the operating modes is implemented by the thermostat. The sensors can be connected directly to the Fan Coil Actuator in order to consider the monitoring of the condensed water and the window contact.

In order to correctly implement this function the thermostat must send the actual temperature as well as the corresponding operating mode to the Fan Coil Actuator via the bus.

4.2.1 Automatic operation

With automatic fan control, a fan drive is connected directly to the Fan Coil Actuator and switched via three floating contacts. A single stage (speed), two stage or three stage fan can be connected.

The fan speed is set automatically in dependence on the control value. For example, the following control value ranges can be programmed for the corresponding fan speeds:

Control value	Fan speed
0... 9 %	0 (fan off)
10... 39 %	1
40... 69 %	2
70...100 %	3

Important
The Fan Coil Actuator FCA/S is purely an actuator, which does not have a controller for a room temperature controller (thermostat).

ABB i-bus® KNX

Planning and Application

Control of the room temperature is implemented using a room temperature controller which generally detects the room temperature. The FCA/S primarily controls a fan and valves. In addition to a manual control via the communication objects *Fan speed x*, *Fan speed switch* or *Fan speed up/down*, the Fan Coil Actuator can also operate in automatic mode together with a thermostat. Communication objects *Control value HEATING*, *Control value COOLING* or when operating with just a single input variable, the communication object *Control value HEATING/COOLING*, are available.

The automatic mode is enabled in the parameter window *Fan* with the parameter *Enable automatic operation*. Depending on the HVAC system, this is set in the parameter window *Control input* and the control value communication objects are enabled.

An automatic operation parameterized in the ETS only becomes active after the first download. With a subsequent download the automatic operating state (active, inactive) is retained as it was before the download. However, there is an exception when system properties such as HVAC systems, fan control (changeover, step control) or the fan stage count have been changed (1/2/3). In these cases the automatic mode is activated if the automatic mode has been enabled in the ETS.

Automatic mode is switched off either by a manual setting command via the communication objects *Speed x*, *Fan speed switch* or *Fan speed up/down*, or if a telegram with the value 0 is received via the communication object *Automatic ON/OFF*.

The automatic operation can be reactivated by the communication object *Automatic ON/OFF* or activated with the 1 byte communication object *Change limitation*.

An activation of one of the four limitations or the forced operation does not end automatic operation. By using a range limit (several fan stages are permissible), a limited automatic control with several fan stages (speeds) is possible.

The following functional diagram shows the relationship between automatic and manual operation of the Fan Coil Actuator.

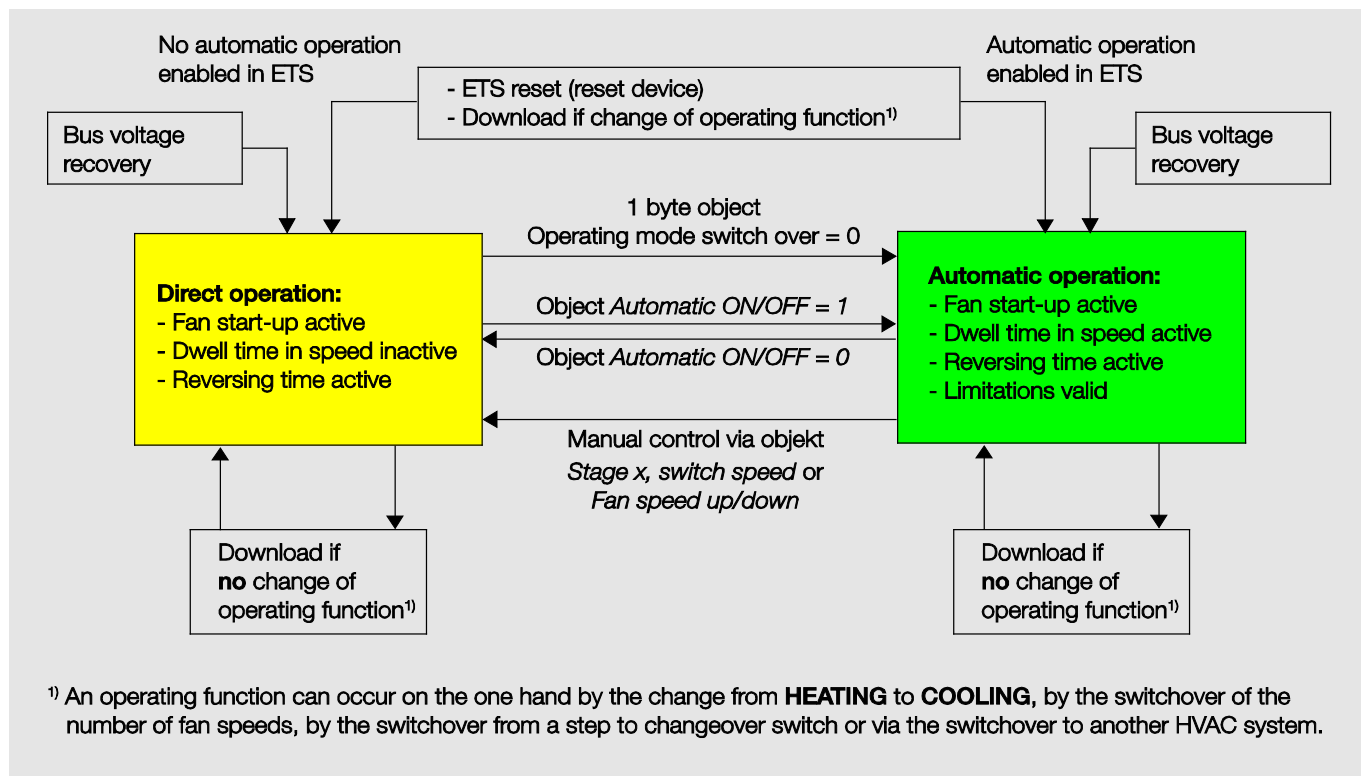

ABB i-bus[®] KNX

Planning and Application

4.2.2 Direct operation

With direct fan control via the ABB i-bus[®], a fan drive is connected directly to the Fan Coil Actuator and switched via three floating contacts. A single stage (speed), two stage or three stage fan can be connected.

The Fan Coil Actuator sets the fan speed in accordance with the value received via the ABB i-bus[®]. The value is received as a 1 byte value. The conversion of the received 1 byte value to the fan speed occurs in the same way as the automatic fan control via the parameterized threshold values.

<u>1 byte value</u>	<u>Fan speed</u>
0... 9 %	0 (fan off)
10... 39 %	1
40... 69 %	2
70...100 %	3

4.2.3 Switchover between automatic and direct operation

In the Fan Coil Actuator, you can switch between automatic operation and direct operation. The changeover to manual fan control is implemented via a 1 bit value. The fan stage is switched in accordance with the received 1 byte value.

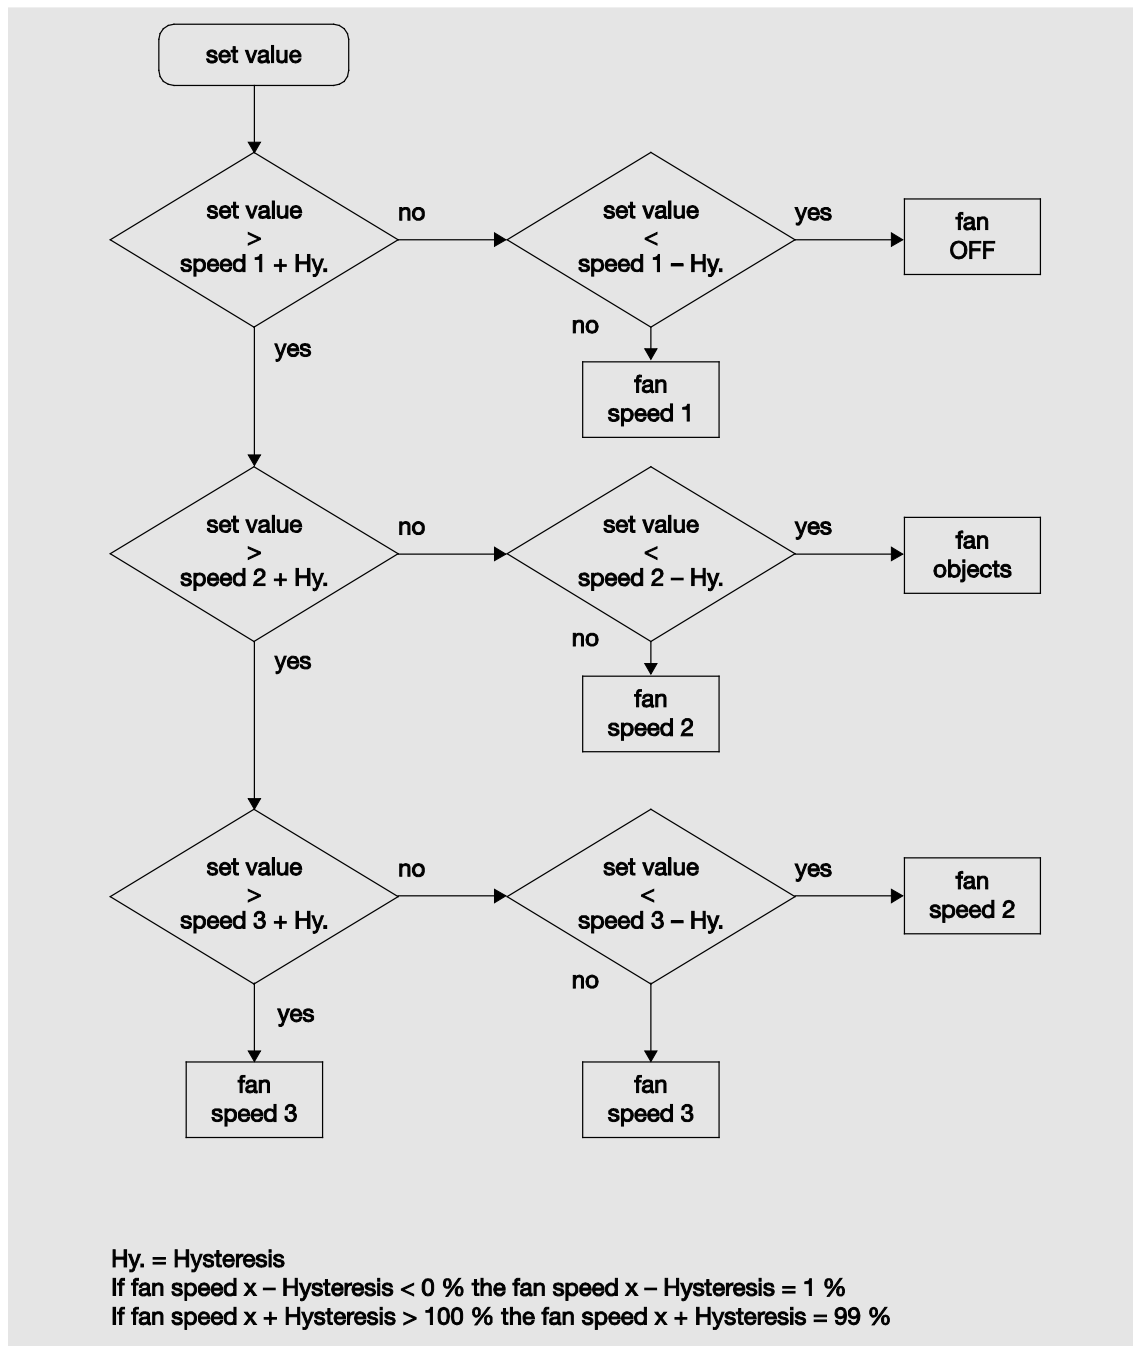

The fan control is changed back to automatic operation if a 1 is received in the respective communication object.

The current status of automatic operation is fed-back via a 1 bit value.

4.2.4 Logic of the stage switching

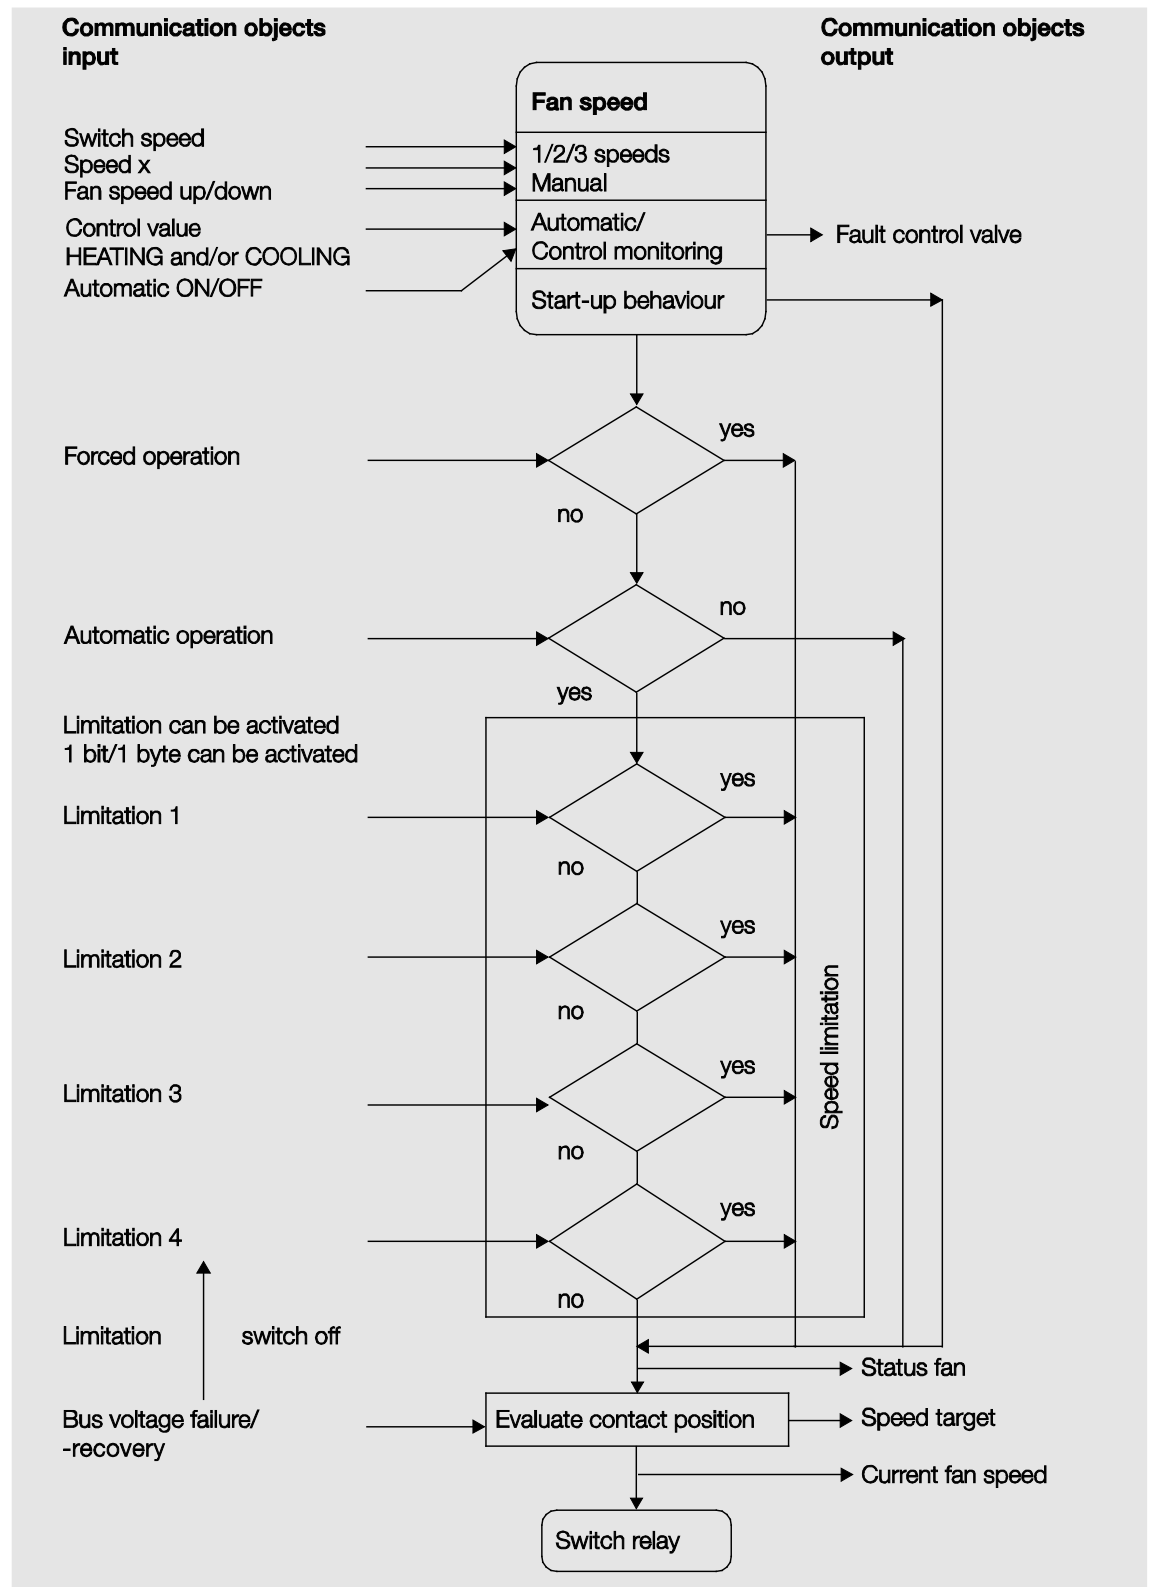

The following illustration indicates the logic of a switchover stage for a Fan Coil Actuator in dependence on the control values and the parameterized threshold values and hysteresis.

The diagram relates to a three speed fan without parameterized fan limitations. The fan limitations are only relevant after the fan stage has been determined and do not change the flow chart.

4.2.5 Fan operation functional diagram

The following illustration indicates the sequence in which the functions of the fan control are processed. Communication objects, which lead to the same box, have the same priority and are processed in the sequence in which the telegrams are received.

4.3 Valve drives, valves and controller

4.3.1 Electromotor valve drives

Electromotor valve drives open and close valves via a small electric motor. Electromotor valve drives are offered as proportional or as 2 or 3-way valve drives.

Proportional valve drives are controlled via an analogue signal, e.g. 0...10 V. They can be controlled with the Fan Coil Actuator. 2 or 3-point valve drives are controlled via switching of the supply voltage.

2-point valve drives are controlled via the telegrams OPEN and CLOSE. The valve can be completely open or completely closed. 2-point valves are controlled via a 2-point control or pulse width modulation (PWM). 2-point valve drives, which require 2-point control, cannot be controlled with the Fan Coil Actuator.

The Fan Coil Actuator does not support the control of electric motor 3-point valve drives. These are normally connected via three connection cables to a Fan Coil unit: Neutral conductor, switched phase to OPEN, switched phase for CLOSE. Using 3-point control valve drives, the valve can be opened by any desired percentage and the position can be retained over an extended period. If the valve does not move, no voltage is applied to the motor.

The valve is opened wide enough to allow the exact quantity of hot or cold water to flow that is required to bring the heat exchanger to the required temperature. Thus the valve is controlled via the valve opening (0...100 %). The control usually used in most cases is continuous control.

4.3.2 Electro-thermal valve drives

Electro-thermal drives are adjusted due to heat expansion of a material caused by a flow of electric current. Electro-thermal valve drives are controlled by pulse width modulation. The Fan Coil Actuator supports the control of electro-thermal valve drives via pulse width modulation.

Electro-thermal valve drives are offered in the *de-energised closed* and *de-energized opened* variants. Depending on the variant, the valve is opened when voltage is applied and closed when no voltage is applied, or vice versa.

Electro-thermal valve drives are connected via two connection cables to the Fan Coil device.

4.3.3

Valve curve

The Fan Coil Actuator controls valves with linear valve curves. The valve control is matched linearly to the control value. The valve is closed with a control value of 0 %, i.e. also 0 %. The valve is fully open with a control value of 100 %, i.e. also 100 %. The same ratio also applies for all intermediate values.

Linear valve curve

These valve curves can be matched for different valve types. Many valves, for example, have practically no flow when barely opened and achieve maximum flow at 60...80 %. Furthermore, many valves emit an annoying whistling sound at low flows.

ABB i-bus® KNX

Planning and Application

These effects can be taken into consideration by limitation of the active valve opening range. The positioning frequency of the valve drive may also be reduced by this limitation.

Limitation of the active valve opening range

ABB i-bus® KNX

Planning and Application

A further adaption of the valve curve is implemented via the limitation of the valve control value. The valve output does not react in the upper and lower range due to this limitation. Thus, for example, a valve movement with a minimal heating or cooling requirement can be avoided.

Limitation of the valve control value

A further adaption of the curve can be undertaken in the [Parameter window - Curve](#), page 72, which is separately adjustable for the heating and the cooling valve. The valve control value can be adapted to the control value using the adjustable parameters there. The positioning frequency of the valve drive may also be reduced by this function.

A reduction of the positioning frequency reduces the current requirement for positioning and extends the service life of the valve. However, a reduced positioning frequency will also impair the accuracy of the temperature control.

4.3.4 Control types

The following control types are commonly used for the control of valves in heating, air-conditioning and ventilation applications.

- [Continuous control](#)
- [Pulse width modulation \(PWM\)](#)
- [Pulse width modulation – calculation](#)

4.3.4.1 Continuous control

With continuous control, a control value is calculated based on the target temperature and the actual temperature, and is used to optimally set the temperature. The valve is brought to a position which complies with the calculated control value. With this method the valve can be fully opened, fully closed and even positioned in every intermediate position.

Continuous control is the most precise form of temperature control. At the same time, the positioning frequency of the valve drive can be kept low. Continuous control can be implemented with the FCA/S for electro-motor 3-point valve drives. This is implemented via a 1 byte control□.

What is a 1 byte control?

For 1 byte control, a value of 0...255 (corresponds to 0 %...100 %) is preset by the room thermostat. At 0 % for example, the valve is closed and at 100 % it is fully opened.

4.3.4.2 Pulse width modulation (PWM)

With pulse width modulation, the valve is operated as with 2-point control exclusively in the positions *fully opened* and *fully closed*. In contrast to a 2-point control, the position is not controlled via limit values, but rather by calculated control values similar to continuous control.

The control value is fixed for a timed cycle and recalculated in the duration for valve opening. The control value 20 % at a cycle time of 15 minutes, for example, will be recalculated for a valve opening time of three minutes. The control value 50 % results in a valve opening time of 7.5 minutes.

With pulse width modulation, a relatively accurate setting of the temperature can be achieved without any resulting overshoots. Simple, attractively-priced control valves can be used. The positioning frequency of the control valve is relatively high.

Pulse width modulation can be used with the Fan Coil Actuator in conjunction with electromotor or electro-thermal valve drives.

ABB i-bus® KNX

Planning and Application

An example: When the FCA/S receives a 1 byte control value (continuous control) as an input signal, this value together with the parameterized cycle time from a PWM calculation is converted into a signal for a 2-point control (ON-OFF-ON).

With PWM control, the received control value (0...100 %) calculated in the control algorithm is converted to a pulse width modulation. The conversion is based on a constant cycle time. If the FCA/S for example, receives a control value of 20%, then for a cycle time of 15 minutes the valve will be opened for three minutes (20% of 15 minutes) and closed for 12 minutes (80% of 15 minutes).

4.3.4.3 Pulse width modulation – calculation

With pulse width modulation, the control is implemented by a variable mark-space ratio.

During the time t_{ON} the valve is opened and during the time t_{OFF} it is closed.
Due to $t_{ON} = 0.4 \times t_{CYC}$ the valve is set to about 40 % on. t_{CYC} is the so-called PWM cycle time for continuous control.

4.4 Behaviour with, ...

4.4.1 Bus voltage recovery

General

- At bus voltage recovery, the communication object values can be parameterized; if not they are set to the value 0.
- Timers are out of operation and should be restarted.
- Status communication objects are sent as long as the option *after a change* has been set.
- The contact positions of the fan speeds are not known after bus voltage recovery. It is assumed that the contact positions have not changed during bus voltage failure (no manual operation possibilities occur). Only after a new switch event is received are the contact positions known to the Fan Coil Actuator.
- The send delay is only active at bus voltage recovery!

Switch contact output

- The communication object value *Staircase lighting time* remains unchanged as before bus voltage failure.
- The communication object value *Disable time function* is dependent on the selected option.
- The communication object value *Permanent ON* remains unchanged as before bus voltage failure.
- The switch contact output switches as follows:
 - After the set communication object value *Switch* with bus voltage recovery.
 - If the parameter *Object value "Switch" at bus voltage recovery* is not parameterized, the behaviour at bus voltage failure is decisive.
 - If none of the two above options is selected, the last position is retained as with bus voltage failure.

Note
If a staircase lighting time was active at bus voltage failure, it will restart.

ABB i-bus® KNX

Planning and Application

Valves V1/2

- The purging cycle restarts if it was active before the failure.
- The priorities *Blocking*, *Forced operation* and *Purging* are re-established and executed as priorities.

The priorities are defined as follows:

1. Manual operation, if active
2. Parameterized valve position after bus voltage recovery
3. Communication object *Block*
4. Communication object *Forced operation*
5. Valve Purge
6. Control values

Note
1 corresponds to the highest priority.

- The value parameterized for bus voltage recovery is only carried out if no higher priority was active before the failure. If a new control value is received during bus voltage recovery and an active priority, it will replace the control value that was defined in the parameterization.

4.4.2

ETS reset

What is an ETS Reset?

Generally an ETS reset is defined as a reset of the device via the ETS. The ETS reset is initiated in the ETS3 under the menu item *Commissioning* with the function *Reset device*. This stops the application program and it is restarted.

Output A (20 AX)

- The communication object value *Staircase lighting time* receives its parameterized value.
- The communication object value *Disable time function* is 0, i.e., function *Time* is not blocked.
- The object value *Permanent ON* is 0, i.e., permanent on is not active.
- The switch contact output goes to the safely opened state.

Note
For all resets after delivery including the first download, the response will comply with that of a reset via the bus. A send and switch delay is not executed. All states are reset.

4.4.3 Download (DL)

General

After a change of the fan control (stage control or changeover control) of the fan type, a full reset of the actuator is required in order to avoid incorrect function. This full reset has the same effect as reset of the device in the ETS. In this case, the communication objects are normally written with the value 0. The timers stop and are set to 0. Status communication objects are set to 0 (with the exception of automatic, if it is active) and contacts are opened.

With the normal download, where no re-parameterization of the fan type and fan control has occurred, an action has the effect that in the ideal case no unwanted reactions are initiated and thus normal operation is not influenced. Communication object values remain unchanged. Timer will not operate and must only be restarted. Status values are updated and sent. The contact position remains unchanged and only changes with the next switch telegram.

Note
After a download with a change, the application complies in behaviour to a reset of the device in the ETS. If the application of the same version is reloaded after discharge, the behaviour is the same as with a download

Output A (20 AX)

The communication object value *Staircase lighting time* remains unchanged.

The communication object value *Disable function time* remains unchanged.

Exception: The communication object value is set to 0 if there is no assignment to the communication object.

Note
Otherwise, the block for the function <i>Time</i> is removed, if the communication object <i>Disable function time</i> is not available. The switch contact output will otherwise use the new parameters.

The communication object value *Permanent ON* remains unchanged.

The switch contact output remains unchanged.

4.4.4 Bus voltage failure

After the contact positions have set with bus voltage recovery, the Fan Coil Actuator remains functional until the bus voltage recovers.

Only the energy for a non-delayed switching action is available when the bus voltage fails for each output. Reversing times, dwell times and startup behaviour cannot be considered. For this reason, it is only possible for the fan at bus voltage recovery to retain the fan speed (unchanged) or to switch off.

The special behaviour is described in the following table.

ABB i-bus® KNX

Planning and Application

4.4.5 Bus voltage failure, recovery and download

Behaviour of the fan stage on a download, ETS reset, bus voltage failure and recovery

Behaviour with	Bus voltage recovery	Bus voltage failure	Download, if no change of the operating function ¹⁾ occurs.	ETS bus reset and download (if a change of operating function ¹⁾)
Fan				
Fan speed	Can be parameterized	Can be parameterized	Unchanged or moves from a previously selected required stage, if this has not been achieved by switchover pauses and dwell times.	OFF, contacts open
Forced operation	Inactive	No function Fan stage as parameterized with BVF	OFF, inactive	OFF, inactive
Limitation x x = 1...4	Inactive	No function Fan stage as parameterized with BVF	OFF, inactive	OFF, inactive
Automatic operation	Automatic mode is activated,, if automatic mode is possible.	No function	Is retained if already available. Remains inactive, if already inactive.	Automatic mode is activated if automatic mode is possible, otherwise not active.
Communication object <i>Status automatic</i>	Is updated and sent in dependence on the parameterization	No function	Is updated and sent in dependence on the parameterization	Is updated and sent in dependence on the parameterization (always, after a change, not)
Communication object <i>Status fan ON/OFF</i>	Will be updated and sent	No function	Unchanged, implemented when the next telegram is received	Is updated (OFF, communication object value 0) and sent.
Communication object <i>Valve control</i>	Values are recalculated and sent after the parameterized send delay	No function	Unchanged and sent.	COOLING or COOLING/HEATING, communication object value 0
Status byte	Values are updated and sent in dependence on the parameterization.	No function	Values are updated and sent in dependence on the parameterization.	Values are updated and sent in dependence on the parameterization (always, when changed, not)

¹⁾ An operating function can occur by the change from fan stage 1, 2 or 3 or to the switchover to a stage and changeover circuit of the fan control.

ABB i-bus® KNX

Planning and Application

Behaviour of the output on a download, ETS reset, bus voltage failure and recovery

Behaviour with	Bus voltage recovery	Bus voltage failure	Download, if no change of the operating function ¹⁾ occurs.	ETS bus reset and download (if a change of operating function ¹⁾)
Output				
Communication object <i>Switch</i>	Can be parameterized	Communication object no longer available.	Unchanged. Evaluation only after a new event has been received.	Contacts go to a safe state. Renewed evaluation only after a new event has been received.
Function <i>Time</i> disable communication object <i>Disable time function</i>	Can be parameterized	Communication object no longer available. Timer stops. Contact position parameterized with BVF	Unchanged.	Contacts go to a safe state. Renewed evaluation only after a new event has been received.
Staircase light	In the parameter window, you can be set if the function <i>Time</i> is disabled or not disabled after bus voltage recovery. Timer stops. Light stays on, if staircase lighting time has run with BF. Otherwise unchanged. Change only after a new event has been received. The staircase lighting time is retained.	No function. Contact position with bus voltage failure can be parameterized	Unchanged. Change only after an event has been received. e.g. the staircase lighting remains on until it is started again or switched off The staircase lighting time is accepted from the parameter. Exception: <ul style="list-style-type: none"> • New device • Initial parameterization 	Running staircase lighting time stops. Switch contact is opened. Staircase lighting timer is set to 0. Staircase lighting time is set to the value parameterized in the ETS. The staircase lighting time sent via the bus is overwritten and is lost. If a function <i>Time</i> is parameterized this will remain active. The communication object <i>Disable time function</i> is reset to the value 0 (function <i>Time</i> activated).
Permanent ON	Permanent ON becomes inactive. Contact position is determined via communication object value <i>Switch</i> .	No function. Contact position with bus voltage failure can be parameterized	Is inactive after a download.	Inactive

¹⁾ An operating function can occur by the change from fan stage 1, 2 or 3 or to the switchover to a stage and changeover circuit of the fan control.

ABB i-bus[®] KNX

Planning and Application

Behaviour of the valves on a download, ETS reset, bus voltage failure and recovery

Behaviour with	Bus voltage recovery	Bus voltage failure	Download, if no change of the operating function ¹⁾ occurs.	ETS bus reset and download (if a change of operating function ¹⁾)
Valves			Communication object values are available	
Valve operation	Can be parameterized	Can be parameterized	Calculation/evaluation will be continued with the existing communication object values (input values)	Calculation/evaluation for valve control is set. Valve is closed (reference run = run time + 5 %)
Functions	Unchanged	Unchanged, however without function. Contact position is programmable.	Will be accepted, if changed	Will be accepted, if changed
Monitoring (communication object <i>Thermostat fault</i>)	Monitoring time will be restarted. Communication object value is 0	No monitoring	Monitoring time will be restarted. Communication object value unchanged.	Monitoring time will be restarted. Thermostat fault is reset
Behaviour forced operation	Inactive, must be reactivated.	Inactive	Inactive	Becomes inactive
Valve purge	Monitoring time restarts.	Time is lost. No purging.	Monitoring time restarts.	Monitoring time restarts.

¹⁾ An operating function can occur by the change from fan stage 1, 2 or 3 or to the switchover to a stage and changeover circuit of the fan control.

A Appendix

A.1 Scope of delivery

The Fan Coil Actuator is supplied together with the following components. The delivered items should be checked according to the following list.

- 1 x FCA/S 1.2.2.1, Fan Coil Actuator, 0-10 V, MDRC
- 1 x installation and operating instructions
- 1 x bus connection terminal (red/black)
