Device types	32

## SETUP CLOUD

### Prerequisites

#### 1. Power supply

Master Server requires a DIN rail power outlet for its own supply. Not included.

#### 2. Network

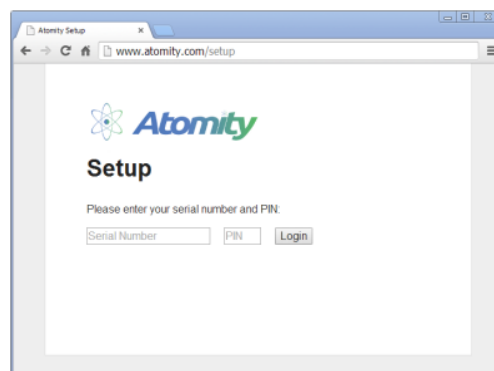

Master Server needs access to the internet for syncing the configuration stored in our cloud server during *Initial Setup*.

#### 3. Master Server

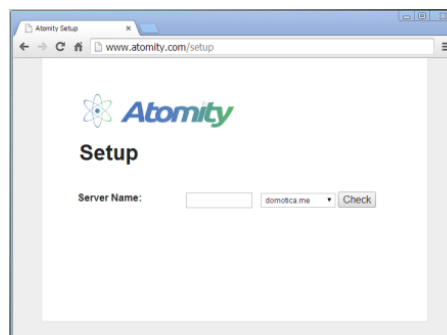

Locate the unique serial number and PIN included in the package content.

### Cloud Setup

1. Connect the device to a router with internet connection using an ethernet cable and power it on.
2. Go to [www.atomity.com/setup](http://www.atomity.com/setup) and identify your Master Server: Enter its serial number and PIN and click "Login" button.

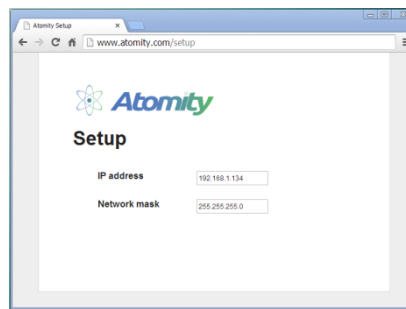

3. Choose a server name to identify it. Enter the name and press "Check" to verify it is not in use. Click "Save" button.

 Please take into account it is not possible to undo this action later

4. Change network parameters if necessary. Default IP address: 192.168.1.220.

5. Add user groups: You can create up to 4 different groups of users. At least one of them must be "Admin".

Differences between existing types of users:

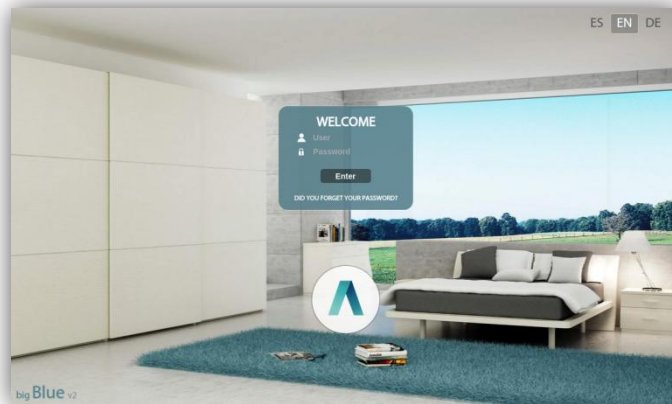

Type	Access to...	System recipes visibility
<b>Admin</b>	All pages	Yes
<b>Owner</b>	All pages except <i>Settings &gt; Devices</i>	No
<b>User</b>	All pages except <i>Settings</i>	No

At this point, our Cloud Server will update your Master Server. Once the update process has finished a message will be shown. Otherwise, please refer to Annexes - Troubleshooting section.

**✖ NOTE:** iOS and Android devices register process is made *per User* via Master Server app. Please go to *Visualization* section for more information about it

## FIRST ACCESS

1. Open your favorite web browser (Chrome, Firefox...) and go to its local IP (default <http://192.168.1.220>). The *Welcome page* will be shown:

2. Log in using administrator user and go to *Settings* menu (hidden menu at the right of the screen).

## BASIC CONFIGURATION

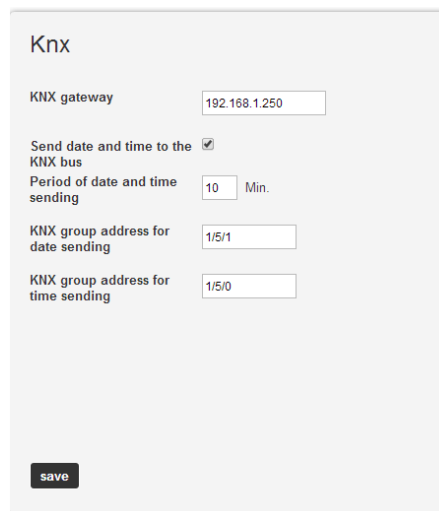

Please go to *Settings* » **Configuration**

Basic configuration requires adjusting the following parameters:

1. **Latitude and longitude** of building localization (astronomical clock)

These values can be obtained in the web page <http://itouchmap.com/latlong.html>

2. **KNX NET/IP gateway address.** The Master Server will connect to KNX system using this device.

The screenshot shows a configuration window titled "Knx". It contains the following fields and controls:

- KNX gateway:** A text input field containing the value "192.168.1.250".
- Send date and time to the KNX bus:** A checkbox that is checked.
- Period of date and time sending:** A numeric input field containing "10" followed by the text "Min."
- KNX group address for date sending:** A text input field containing "1/5/1".
- KNX group address for time sending:** A text input field containing "1/5/0".
- save:** A black button with white text located at the bottom left of the form.

The rest of parameters (language, currency, etc.) will not affect to its functionality.

 **NOTE:** In case of changing network parameters, the system will require a reset (*Settings* » **Reset**) to ensure its correct application

## BUILDING HIERARCHY DEFINITION

Go to *Settings* » **Hierarchy** for defining the installation physical structure, consisting in a certain number of *Buildings*, *Floors* and *Rooms*.

Factory default includes a basic hierarchy structure containing one Building, one Floor and one Room:

Define its hierarchy by creating “New buildings”, “New floors” and “New rooms”. Properties per room:

- Name
- Icon
- Background image (JPG o PNG)
- Container opacity

This structure can be customized using these different actions:

- **Adding new zones**

Definition of zones of the building can be performed using *New building*, *floor* and *room* buttons.

- **Modifying and removing existing zones**

Please hold the button of the desired zone. Two new buttons will appear:

X: remove zone  
E: edit zone

Once the whole building structure is complete you can begin to define different zone *Devices*.

## WORKING WITH DEVICES

Please follow the next steps to define building devices:

1. Go to *Settings* » **Devices**, section “New device”

The 'New device' form contains the following fields:

- Name:** A text input field for the device name.
- Location:** A dropdown menu with 'Room - Floor - My home' selected.
- Category:** A dropdown menu with 'Lighting' selected.
- Protocol:** A dropdown menu with 'KNX' selected.
- Device type:** A dropdown menu with 'Simple light' selected.
- Show in display:** A checkbox that is checked.
- Parameters:** A section with three rows of three checkboxes each, labeled 'On/Off:', 'Status:', and 'Answer if reading:'. A 'Save' button is at the bottom.

2. Give the new device an unambiguous *Name*
3. Choose an icon
4. Indicate which will be its *Location* in the installation, according to the previously defined hierarchy
5. Select the *Category* which best matches device *class*:

Lighting	HVAC	Generic controls	Energy
Blinds	Safety	Weather	Multimedia
6. Define its *Protocol*:

KNX	Sonos	Philips Hue
-----	-------	-------------
7. Define if this particular device should be shown in the display or not
8. Indicate the *Type* of device, depending of both selected *Category* and *Protocol*. Examples:

**KNX**

Parameters

On/Off: ☐ / ☐ / ☐

Status: ☐ / ☐ / ☐

Answer if reading: ☐

**Sonos**

Parameters

IP:

**Philips Hue**

Parameters

ID:

**IP Cameras**

Parameters

URL:

Left button scene:

Right button scene:

✗ Sonos devices: please remember to assign them a static IP (linking its MAC address via router configuration) to ensure it doesn't change with time

9. Store the declared *Device* by pressing *Save* button

Existing devices declaration can be accomplished by repeating previous steps. A list of all created devices can be found in *Devices* section:

### **Modifying, copying or removing an already created device**

In case of pressing over an already existing *Device*:

1. *New Device* section will show its actual parameters, permitting to edit them.
2. Furthermore, two additional buttons will appear to perform the following actions:
  - Remove the selected device (X)
  - Duplicate it (D)

### **Other devices**

In addition to declared devices, the Master Server provides some special devices:

#### **Communications**

Scenes, Recipes & Calendars » Categories » Communications

1. ***Push notification device***, for sending customized notifications to any registered (via user) iPhone/iPad.

Recipient	Administrator
Message	<div></div>

1. ***Email device***, for sending users an email with the desired text.

Recipient	Administrator
Subject	<div></div>
Message	<div></div>

This particular device can be utilized for sending *Zennio Energy Meter* device stored values using one of the following pointers:

**Energy (kWh)**

<<@@EnerT@@>>

<b>Cost (€)</b>	<<@@CosteT@@>>
<b>Total emissions (ppm)</b>	<<@@CO2T@@>>
<b>Power (W)</b>	<<@@Potl@@>>

## Weather

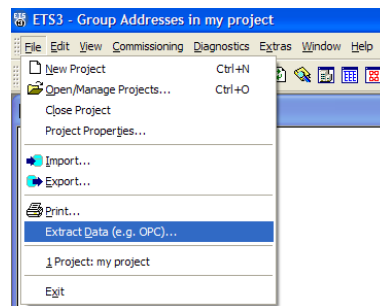

Recipes » Categories » Weather (once both latitude and longitude values have been declared)

1. **Astro:** Dawn and Nightfall devices
2. **Yahoo Weather:** Temperature and Wind speed devices, read from [Yahoo Weather](#) service. **Internet connection required.**

## Importing KNX Devices from an ETS database

Master Server helps you in the task of defining new devices by allowing you to import all your project group addresses. It can be accomplished as follows:

1. Open your ETS project
2. **ETS3:** Go to File » Extract Data

Go to *Export to OPC Server* section and click *Export* button

**ETS4:** Go to Extras » Export to OPC Server

3. Give it a name without blank spaces and save it as an .esf file (i.e. my\_project.esf)
4. Go to *Settings* » **Devices**, section "Import ETS project" and select the \*.esf file

5. Click *Upload* button. ETS group addresses will appear in "Imported ETS" section once the process has finished:

Address	Description	Size
0/0/1	Group address 1	1 bit
0/0/2	Group address 2	1 byte
0/0/3	Group address 3	1 bit
0/0/4	Group address 4	1 byte
0/0/5	Group address 5	1 bit

6. At this point, it is possible to drag and drop any of the imported group addresses to *Parameter* section.

The 'New device' form shows fields for Name, Location, Category, Protocol, Device type, and Show in display. The 'Parameters' section has 'On/Off', 'Status', and 'Answer if reading' fields. The 'Imported ETS' table lists addresses and descriptions. A red arrow indicates the drag-and-drop action from the '1/0/5' address to the 'On/Off' parameter field.

As a result, both *Group address* and *Description* will be copied to *Parameter* and *Name* fields:

The 'New device' form now shows the 'Name' field populated with 'ABRE PUERTAS' and the 'On/Off' parameter field populated with '1 / 0 / 35'. The 'Status' and 'Answer if reading' fields remain empty.

## THE VISUALIZATION

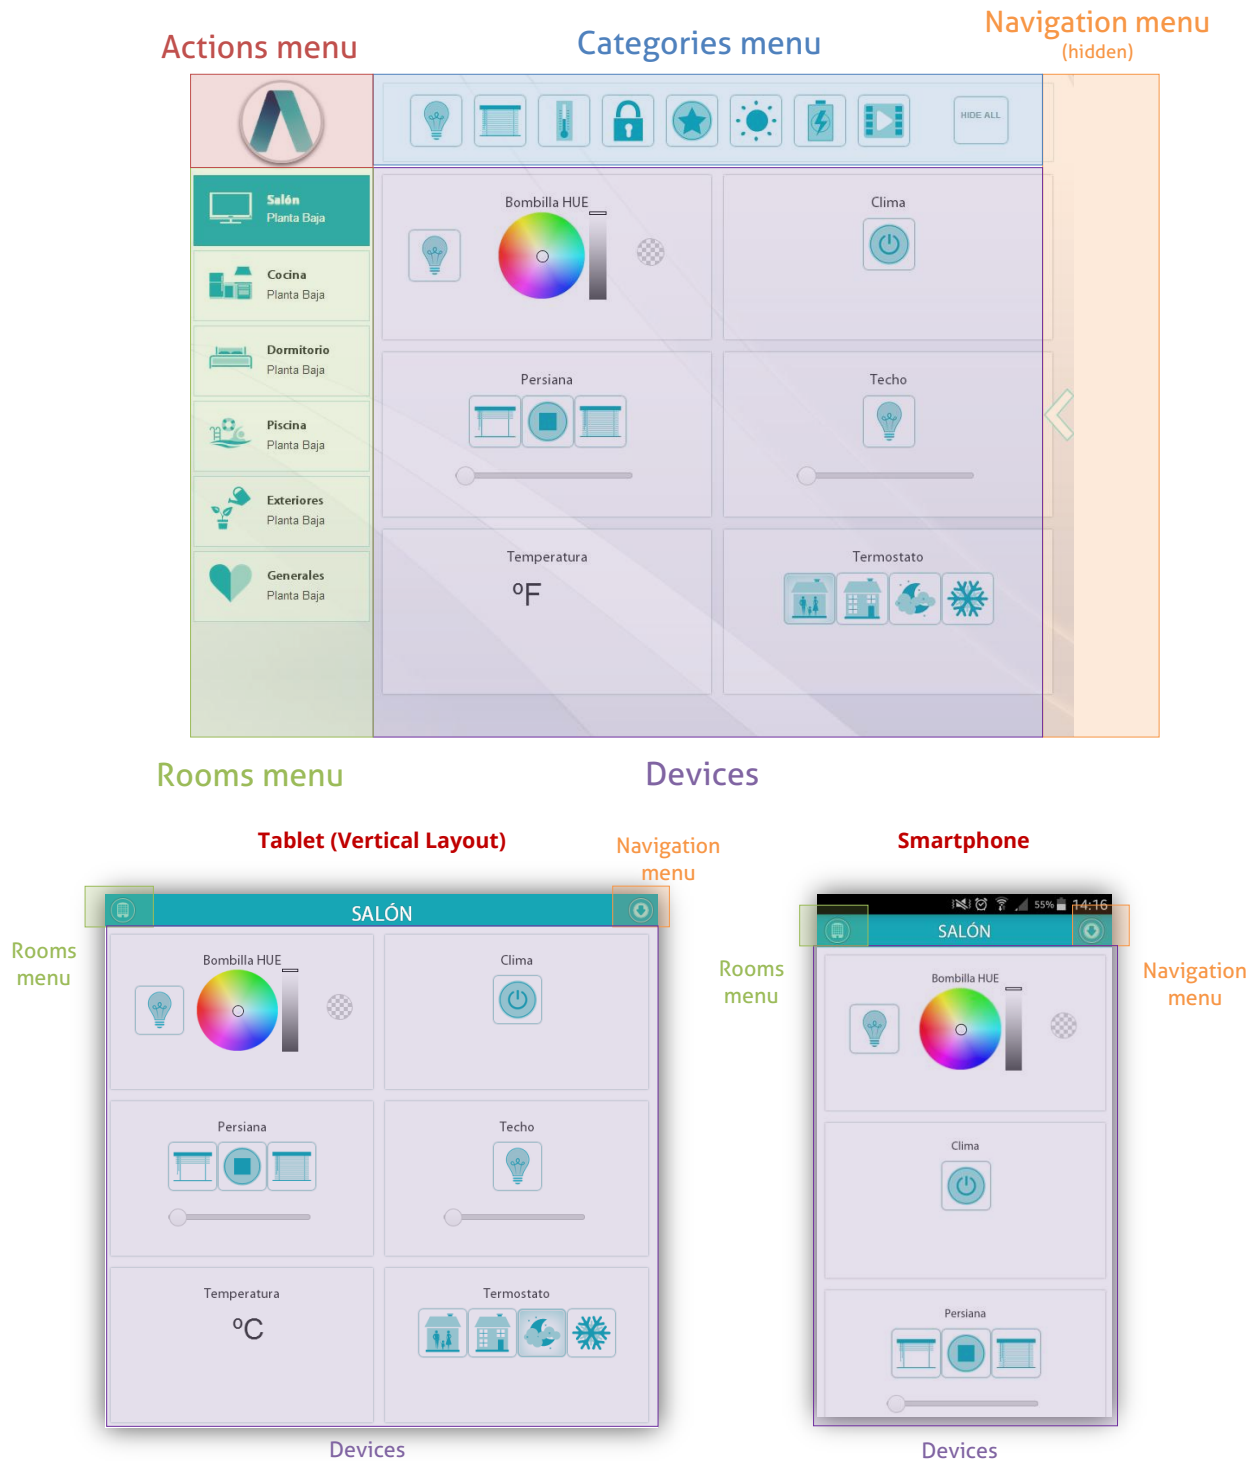

The visualization permits end users to:

1. Examine and modify the state of various constituent building elements
2. Display actual values of measured variables (wind speed, humidity, room temperature, etc.)

4 visualizations in 1, **generated automatically**.

**PC, SMART TV,... (web browser devices) + Tablet (Horizontal Layout)**

Its structure can be divided in 5 sections:

### Actions menu

Tap over it to show basic actions menu:

- User Log out
- Reset/Shut down the Master Server

### Rooms menu

It consists in a list of all the created rooms when defining the building *hierarchy*.

In case of pressing over any of them, selected room devices will be displayed.

### Categories menu

Filter menu (lighting, blinds, scenes, etc.), to help in building control by displaying only selected category devices.

The filter can be globally controlled by pressing "Hide/Show all" button.

### Devices

Main section of the page. It displays all the existing devices, depending on:

1. Selected room
2. Filtered categories

### Navigation menu

Initially hidden menu which contains a link to Scenes, Recipes, Calendars,...

To display it, please perform a "right-to-left swipe" movement over the right side arrow.

### iOS/Android app: Master Server app

Master Server app is a free application which allows users to access directly to the visualization, without requiring remembering its IP address, nor having to enter user and password.

You can install and configure it as follows:

1. Go to the App Store/Google Play and search for "Master Server"
2. Install and open it

3. Configuration page will be shown:

A screenshot of the MasterServer configuration screen. It has a white background with a blue "OK" button in the top right corner. Below the button are three input fields labeled "SerialNumber", "User", and "Password". At the bottom, there is a stylized atomic symbol logo and the website address "www.atomity.com".

Enter required data and press "OK". The iOS device will be linked to the selected *User* (remember push notifications are sended *per User*, consisting in one or more iOS devices) and all the parameters stored in our Cloud server will be automatically downloaded.

In case any of the data is wrong please shake your device to return to Configuration page.

 Please take into account remote access requires ports **80** and **8000** to be opened

## SCENES

List of actions to be performed jointly. Example “*Not at home*”: Blinds down; Climate off; Lights off

A new scene can be created following these steps:

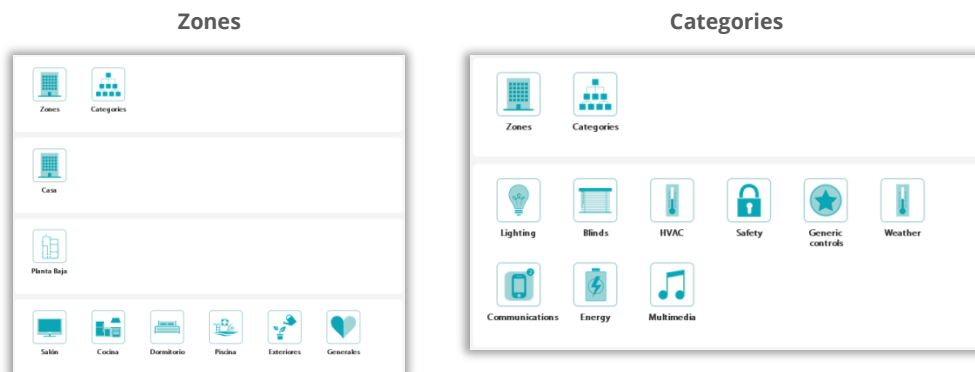

1. Go to *Visualization » Sidebar » Scenes*

2. Press “New scene” button
3. Configure the new scene basic parameters:
  - Name
  - Icon
  - Room allocation (if necessary, for displaying it in the visualization)

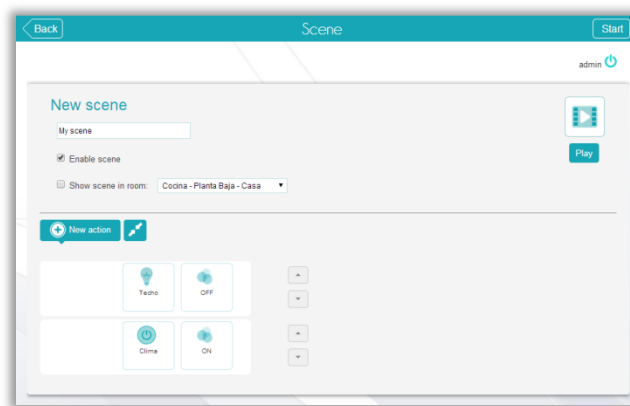

4. Press “New action” button to select a particular building Device and its desired state. This selection can be done by Zones or Categories, showing in each case a list of all existing devices:

A delay can be configured for each new added action.

5. Press “Save” button

It is possible to create a list of actions to be performed repeating previous steps:

### Rearranging the list of actions

This action can be accomplished by clicking over the up/down arrows existing at the right of each listed device.

### Modifying, copying or removing an already associated action of a scene

In case of pressing over any "already added to scene" Device:

1. Both actual configured state and associated delay will appear to permit its modification.
2. Two additional buttons will become visible to perform one of the following actions:
  - X: Remove the selected action from the scene
  - D: Duplicate it

### Copying and deleting an already created scene

This action can be performed this way:

1. Go to *Visualization » Sidebar » Scenes*
2. Hold the scene button. Two new buttons will become visible:
  - X: Remove the selected scene
  - D: Duplicate it

### Playing an scene externally using a URL

Please go to the API reference to know how to do this action.

## RECIPES: BASIC LOGICAL FUNCTIONS

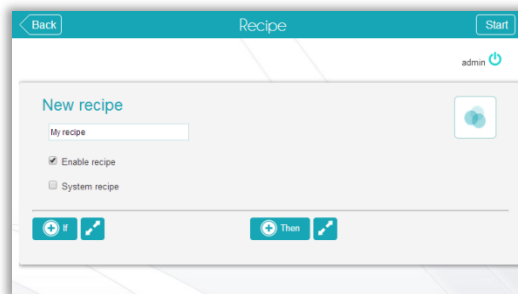

Immediate logical functions for end user, "if this event happens then these actions must be performed".

Steps:

1. Go to *Visualization » Sidebar » Recipes*

2. Press "New recipe" button
3. Configure the new recipe basic parameters:
  - Name
  - Icon
  - System recipe (depending on whether you want it to be visible or not for Owner/User users)

4. Press "If" button to select:
  - a particular building *Device*; This selection can be done by *Zones* or *Categories*, showing in each case a list of all existing devices
  - the condition that must be met in order the action to be performed
  - if the result of the condition must be evaluated with every new received value or just when a change in previous result happens:

☒ Evaluate only in case of a change in final result

5. Press "Then" button to select a particular building *Device* and its desired state. This selection can be done by *Zones*, *Categories*, *Calendars* or *Scenes*.

A delay can be configured for each new added action.

6. Press "Save" button.

It is possible to create a list of actions to be performed repeating previous steps:

### **Rearranging the list of actions**

This action can be accomplished by clicking over the up/down arrows existing at the right of each listed device.

### **Modifying, copying or removing an already associated action of a recipe**

In case of pressing over any "already added to recipe" Device:

1. Both actual configured state and associated delay will appear to permit its modification.
2. Two additional buttons will become visible to perform one of the following actions:
  - X: Remove the selected action from the recipe
  - D: Duplicate it

### **Copying and deleting an already created recipe**

This action can be performed this way:

1. Go to *Visualization » Sidebar » Recipes*
2. Hold the recipe button. A new button will become visible:
  - X: Remove the selected recipe

## CALENDARS: PROGRAMMED ACTIONS

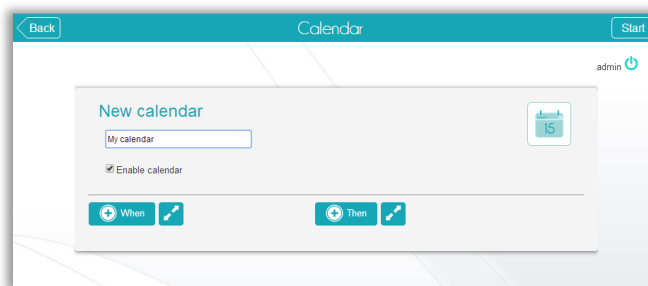

Daily, weekly, monthly and yearly schedules.

Steps:

1. Go to *Visualization » Sidebar » Calendars*

2. Press "New calendar" button
3. Configure the new calendar parameters:
  - Name
  - Icon

1. Press "When" button to select new calendar periodicity. Example:

Daily Weekly Monthly Yearly

Start: 10:40 End

End at: 10:40 During: Minutes 0

Start calendar

Today Choose date

Repeat

Always Until date Set repetitions

Summary of options:

When	Value	OR	Type of value
Daily	Start		hour
	End	At	hour
		During	minutes
	Calendar start	Today	
		Date	date
	Repeat	Always	
		Until date	date
Weekly	Frequency	Day of the week	M-S (1 or more days)
	Start		hour
	End	At	hour
		During	minutes
	Calendar start	Today	
		Date	date
	Repeat	Always	
		Until date	date
Monthly	Frequency	Day of month	1-31 (1 or more days)
			First, Second, etc. Day, Working day, Non-working day M-S
	Start		hour
	End	At	hour
		During	minutes
	Calendar start	Today	
		Date	date
	Repeat	Always	
		Until date	date
Yearly	Frequency	Month + Day	J-D + 1-31 (1 or more months & days)
	Start		hour
	End	At	hour
		During	minutes
	Calendar start	Today	
		Date	date
	Repeat	Always	
		Until date	date

1. Press "Then" button to select a particular building *Device* and define its desired state, at the beginning or/and the end of calendar. This selection can be done by *Zones*, *Categories*, *Scenes* or *Scripts (LUA)*.

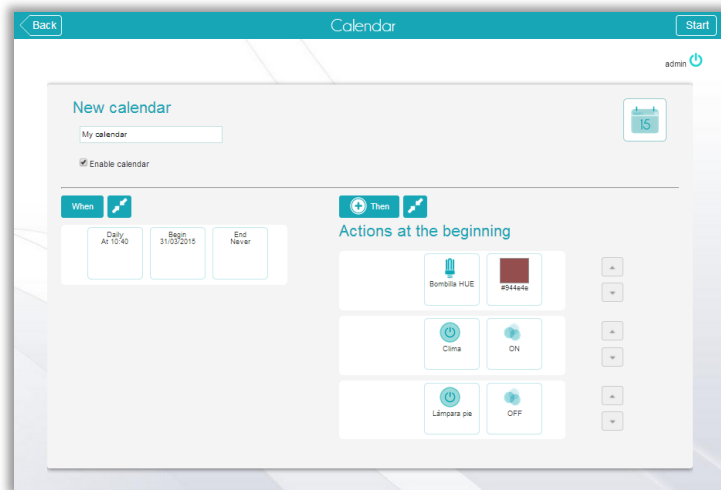

A different delay can be configured for each new added action.

4. Press "Save" button.

Not enabled calendars will exist but not launch.

It is possible to create a list of actions to be performed (at the beginning or at the end) repeating previous steps:

### Rearranging the list of actions

This action can be accomplished by clicking over the up/down arrows existing at the right of each listed device.

### Modifying, copying or removing an already associated action of a calendar

In case of pressing over any "already added to calendar" Device:

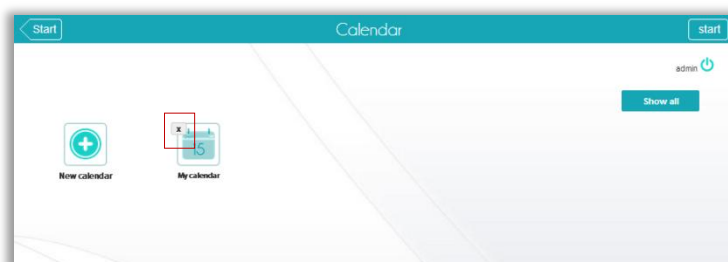

1. Both actual configured state and associated delay will appear to permit its modification.
2. Two additional buttons will become visible to perform one of the following actions:
  - X: Remove the selected action from the calendar
  - D: Duplicate it

### Copying and deleting an already created calendar

This action can be performed this way:

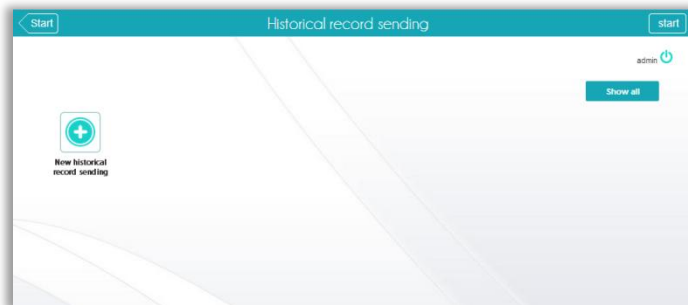

1. Go to *Visualization » Sidebar » Calendars*
2. Hold the calendar button. A new button will become visible:
  - X: Remove the selected calendar

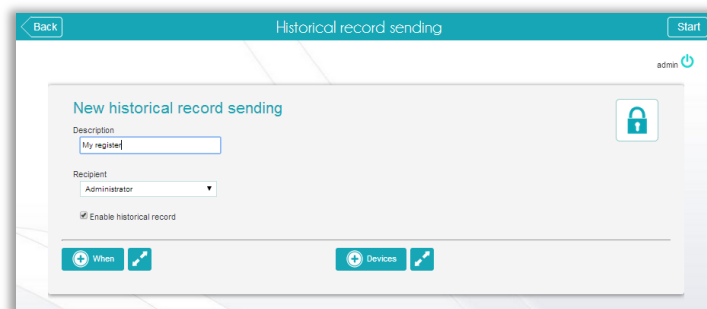

## HISTORICAL: DATA LOGGER

Steps:

1. Go to *Visualization » Sidebar » Historical*

2. Press "New historical record" button
3. Configure new historical basic parameters:
  - Description
  - Icon
  - Recipient, the user who will receive the historical

4. Press "When" button to select new historical periodicty. Example:

Summary of options:

When	Value		Type of value
Daily	Send at		hour
Weekly	Frequency	Day of the week	M-S
	Send at		hour

5. Press "Devices" button to select:

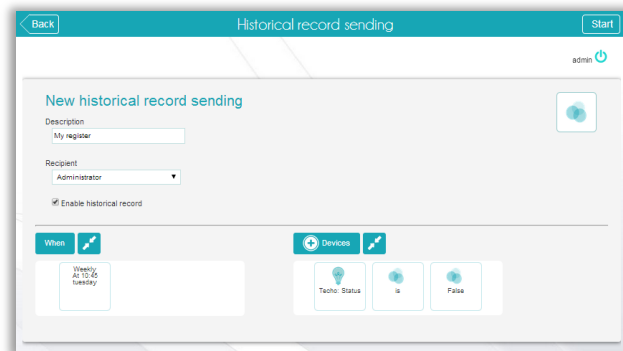

- a particular device of the building; This selection can be done by *Zones* or *Categories*.
- the status that must be met;
- a text to define

6. Press "Save" button to store the changes.

Not enabled historical will record devices status but will not send emails.

It is possible to create a list of devices (and its status) to be recorded:

In this example, the Master Server will log "My new device" and "My push button" changes and will send a daily report at 11:00 to "My user" associated email address:

**From: Mail server**  
**At: 2013-05-03 11:00:00**  
**Subject - Historical: My historical**

Sending frequency: Daily at 11:00 h

My new device: Status ON Value for alarm: 1  
Event 1, Date: 2013-05-02 11:53:10, reading: 1  
Event 2, Date: 2013-05-02 17:00:00, reading: 1

My push button: Status pressed Value for alarm: 1  
There has been no readings during the period.

### Modifying, copying or removing an already associated device of a historical

In case of pressing over any "already added to historical" *Device*:

1. Both actual configured status and text will appear to permit its modification.
2. Two additional buttons will become visible to perform one of the following actions:
  - X: Remove the selected device from the historical
  - D: Duplicate it

### Copying and deleting an already created historical

This action can be performed this way:

1. Go to *Visualization » Sidebar » Historical*
2. Hold the calendar button. A new button will become visible:
  - X: Remove the selected historical

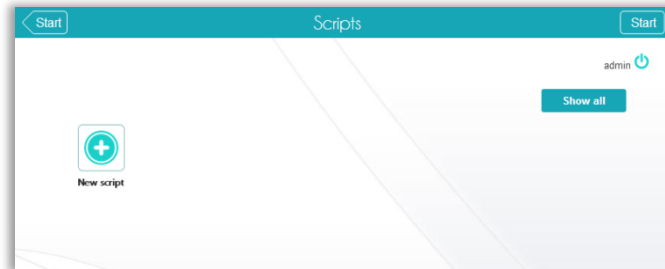

## LUA SCRIPTING: ADVANCED LOGICAL FUNCTIONS FOR SYSTEM INTEGRATOR

Steps:

1. Go to *Visualization » Sidebar » Logic*

1. Press "New script" button
7. Configure its basic parameters:
  - Name
  - Description
  - Icon
  - Script type

 A screenshot of a configuration form titled 'Nuevo Script'. It contains several input fields: 'Name' with the value 'My script', 'Description' with the value 'My first script', and a checked checkbox for 'Enable script'. Below these, there's a 'Type' dropdown menu set to 'Event' and a 'Trigger' field with a plus icon. The form is light gray with a teal header and a teal button in the top right corner.

Script types:

Type	Trigger	
<b>Event</b>	KNX group address(es)	Executed as a result of a reading of certain KNX group address
<b>Resident</b>	1 to 1.000.000 segundos	Evaluated each certain number of seconds
<b>Scheduled</b>	Calendar	Launched by a certain daily, weekly, monthly or yearly calendar
<b>On init</b>	-	Executed during Master Server boot
<b>On shutdown</b>	-	Executed during Master Server shutdown process

2. Press "Save" to store changes. It is possible to verify any particular script by pressing "Execute" and "Result" button.

LUA documentation: <http://www.lua.org/manual/5.3/>

Master Server functions: <http://www.atomity.com/es/referencia-lua>

Functions resume:

Function	Example
KNX.read(groupAddr)	x = KNX.read('1/1/1')
KNX.write(groupAddr,value)	KNX.write('1/1/2',1)
PUSH.send(usrGroup,txt)	PUSH.send('admin','My push notification')
EMAIL.send(usrGroup,txt)	EMAIL.send('admin','My email')
ROOMBA.clean(ip)	
ROOMBA.dock(ip)	
UTILS.sleep(x)	UTILS.sleep(5)
UTILS.ping(ip)	res = UTILS.ping('192.168.0.200')
UTILS.set(name,value)	UTILS.set(myGlobal,1)
UTILS.get(name)	myLocal = UTILS.get(myGlobal)

## Examples

### Two-point control

```
temp = KNX.read('1/0/0')
consigna = 90
histeresis = 2
IF temp < consigna - histeresis THEN
    KNX.write('1/0/1',1) -- SAUNA ON
ELSE IF temp > consigna + histeresis THEN
    KNX.write('1/0/1',0) -- SAUNA OFF
END IF
```

### Pulse counter

```
contador = 1
numveces = 5
disparador = KNX.read('3/0/0') -- Disparador Script
if contador <= numveces then
    contador = contador + 1
else
    contador = 0 -- Reset
end
if contador == numveces then
    -- Acciones
    KNX.write('3/0/1',1)
    SLEEP(10) -- Retardo 10 segundos
    KNX.write('3/0/2',1)
    SLEEP(5) -- Retardo 5 segundos
    KNX.write('3/0/3',1)
    SLEEP(10)
    -- Etc.
end
```

### Overconsumption RGB alarm

```
potenciainstantanea = KNX.read('7/0/0')
umbralalerta = 10000
WHILE potenciainstantanea >= umbralalerta DO
    -- ROJO
    KNX.write('1/0/8',255) -- R
    KNX.write('1/0/9',0) -- G
    KNX.write('1/0/10',0) -- B
    UTILS.SLEEP(2)
    -- OFF
    KNX.write('1/0/8',0) -- R
    KNX.write('1/0/9',0) -- G
    KNX.write('1/0/10',0) -- B
    UTILS.SLEEP(5)
END
```

### OR (climate)

```
zone1 = KNX.read("3/1/1")
zone2 = KNX.read("3/1/3")
zone3 = KNX.read("3/1/5")
IF zone1 OR zone2 OR zone3 THEN -- Demanda alguna de las zonas
    KNX.write("3/1/11",1) -- EV abierta
    UTILS.sleep(5) -- Retardo 5 segundos
    KNX.write("3/1/10",1) -- Bomba impulsión encendida
    -- etc.
ELSE -- Fin Demanda alguna de las zonas
    KNX.write("3/1/10",0)
    UTILS.sleep(5) -- Retardo 5 segundos
    KNX.write("3/1/11",0)
    -- etc.
END
```

### Master Server reboot - Push notification

```
usrGroup = "admin"
txt = "Master Server is booting"
PUSH.send(usrGroup,txt)
```

### Network Server monitoring system

```
ip = '192.168.0.50' -- Servidor red
usr = 'propietario'
txt = 'El servidor no se encuentra disponible'
res = UTILS.ping(ip)
IF res == 0 THEN
    PUSH.send(usr,txt)
END IF
```

## CREATING A BACKUP

It is highly recommended to make a copy of the entire programming so you can restore it in the future.

This action can be performed following these steps:

1. Go to *Settings* » **Backup**, section “*Make copy*”

A light gray dialog box titled "Make copy". It contains a label "Name" followed by a text input field. Below the input field is a dark gray button with the text "Download" in white.

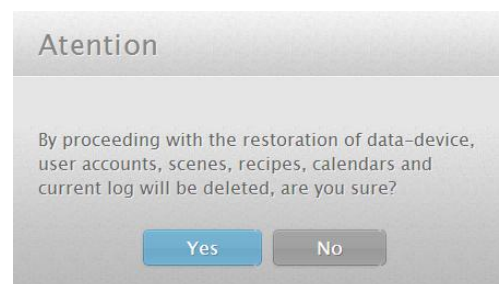

2. Give it a name and click *Download* button
3. A *Name.hpb* file will be created with the entire configuration. Save it in a safe location

Restoration process can be done easily:

1. Go to *Settings* » **Backup**, section “*Restore*”

A light gray dialog box titled "Restore". It contains a button labeled "Seleccionar archivo" followed by the text "Ningún archivo seleccionado". Below this is a dark gray button with the text "Upload" in white.

2. Select the file (*Name.hpb*) which contains the previous configuration
3. Click *Upload* button. A message will be shown asking for your confirmation before proceeding:

A gray dialog box titled "Attention". It contains the text: "By proceeding with the restoration of data-device, user accounts, scenes, recipes, calendars and current log will be deleted, are you sure?". At the bottom are two buttons: a blue "Yes" button and a gray "No" button.

## Icon list

## Factory reset

1. Go to *Settings* » **Backup**, section "Factory reset" and click *Restore* button. A message will be shown asking for your confirmation before proceeding

Your device will reboot with its default settings. It is possible to login into to the system to restore any previously created backup with the following user and password:

<b>User</b>	admin
<b>Password</b>	admin

## API

### v0.1

#### Scenes

##### External Call to a Scene

Scenes can be played from any external app capable of sending URL commands:

`http://master_server_IP/ordenesJSON.php?idEscena=X`

Scene ID (**X**) can be obtained following these steps:

1. Go to *Scenes*
2. Select the particular scene you want to be called
3. The ID is shown at the end of the URL (i.e.: `http://192.168.1.145/escenas4.php?id=3`)

## IP cameras

IP cameras database: <http://www.ispyconnect.com/sources.aspx>

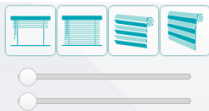

Please verify IP camera URL in any web browser before filling out Master Server required fields

## Troubleshooting
